I am posting this for an acquaintance. He lost his Apple system to a burgler with the exception of the old Apple Graphics Tablet. Apple Computer, Inc. has not supported the tablet in about three years. My acquaintance would like to find someone who has the software to support the tablet. Or maybe someone who is interested in buying the thing. Anyone out there know something about the Apple Graphics Tablet software, etc.?

Can anyone recommend a good backgammon program for either the Apple IIc or the IBM PC? I'd like as much information (price, address) as possible. Thanks.

> swaping in the ones you want.) This doesn't appear to happen on a //c.
> (Note that I used the word "appear." I haven't hacked that hard on a //c,
> but there is something funky in the roms.)
>

Yes, there is something funny in the //c MMU. On regular apples,
you must access $CFFF to tell the other cards to stop using the
expansion area ($C800-$CFFF). After that, you have to access one
of the valid addresses within the ROM of the peripheral card you
want to have switched in. If you don't access $CFFF (and depending
on how smart your cards are) the old ROM bank is kept in, causing
notable havoc.

The //c does all this bank switching automatically. If you access
one "card", and then another, the $C800-$CFFF area is switched
automatically. (You can do this kind of thing when you know that
there is one and only one "card" built in for each function (and you
know exacly where it will be.))

NOT TO MENTION: More I/O ports and "switches" ($C000-$C0FF) were
added to the //c. This may still cause MMU problems.

Good luck trying to get the MMU to recognize a 3.6Meg 6502 though.
:-) :-) :-) :-) :-) :-) :-) :-) :-) :-) :-) :-) :-) :-) :-) :-)

But seriously, by the time you hack through all the address
management and I/O problems, you'll have a //e and not a //c.

The IBM PC community seems to have their act together more than we do, with
the Lotus-Intel-Borland extended memory spec. Why can't there be a
hardware/software standard for addressing more than 64K and 128K of memory?
Does Apple plan to do anything about this except hope that third-party
vendors adopt the 'standard' embodied in their card?

My aplologies for those who have already seen this article,
but I received some mail that said the whole article didn't
make it to the net.

Recently, I've seen two requests for info. on the DAK1200 modem on the
net. I don't own one, but I am in the market for a Hayes Compatible
1200 baud modem. A friend recently purchased one, and I was able to
try it for a few days. I was using an IBM XT with Smarterm 100, a VT100
emulator. I set up macros to do auto dialing and logon on four
different systems. Everything was fine in connecting to two of the
systems, but the modem would not detect the carrier of the other two.
In the two systems that I was able to connect to, I would first hear
the 300 baud carrier, then about a half second delay, and next the
DAK's 1200 baud PSK carrier.

On the two systems that the DAK couldn't detect the carrier for, I then
tried connecting with a UDS1200LP 1200 baud only modem, which worked.
I also used an Apple IIe with a Micromodem IIe and Softerm II, and
was able to again connect to those systems (at 300 baud).

I wonder if these modems are being sold so cheaply ($169. + $6. P&H)
due to this and who knows what other problems (although I experienced
no other problems). This modem was even able to send a Break Character
at 1200 baud, which other low cost modems seem to have trouble with.
I did not put this modem through a series of exhaustive Hayes type
tests, and only used it as described above. Has anyone else had this
problem ?

I have another friend that has had a Prometheus Promodem 1200 for about
a year, with no problems. Since the mailorder price is down to $269.
(Compumail, Dec. 85 Byte, p.470 - (805)987-7015), I think I'll pay
a little more for the insurance!

Since I wrote the above, my friend that owned the DAK 1200 has tried
connecting to every computer and bulletin board that he could find the
number for. He said that the only two computers that he could 'not'
connect to were the ones that I could also not connect to (I think
he's tried at least 10 systems). The two systems in question are
two numbers for our company's computers (ITT Telecom), which I
think are 2400/1200/300 baud modems from Multi-Tech.

He says that he's buying the modem anyway, due to the savings and

the excuse that he has now not to be able to do company work at home!

I went ahead and bought the Prometheus Promodem 1200 which I am now
using (and very happy with!). Unfortunately, Compumail raised their
price to $299. when I called to order it, so I bought it from
Logicsoft for $284. instead (who also refused to sell it to me for
the terms that they had advertised).

There shouldn't be any problems...As a Bulletin Board System Operator,
I have been doing this for quite some time, and have had no troubles.
I know of some systems that have been on 24 hours for over 3 years
without any major hardware troubles except for the disk drives (They
were in constant use, and as being mechanical in nature, they would
be the first to fail! ((They were in use because a BBS is a message
base, and the message must be read from disk every time it is
accessed)))...

  Hi everyone...If anyone is interested, I'm running a Bulletin Board
System in the Champaign, IL area....

It operates from 6pm-8am, is 300/1200/2400 Baud, and has a 10 megabyte
hard drive on-line, with downloads, electronic mail, 8 sub-boards
(message areas), and 9 libraries.

The download section has several areas for IBM, Apple, TI, RS/Tandy, and
Commodore...although since the download section just went up, only
IBM and Apple are well established.

217-359-4450
300/1200/2400 Baud
10 Megabytes
Six pm to Eight am

Note: I just got the Sider Hard drive from First Class Peripherals, and
 it has functioned FANTASTICALLY! The new drive mechanism solves the
 "grinding" noise problems, and it is quieter than my old Disk]['s.
 FCP forgot to include a manual, and I received a bad installation disk,
 but the customer service number is an 800 number, and I received the
 new manual and disk in one week (and half of that week was Thanksgiving
 holiday)

Thanks for the various responses to my request for information on how to change directories in ProDos. I must confess that I have not yet had a chance to put these ideas into practice. One thing still seems unclear, however. Namely, that 'changing a path' does not sound like changing directories in the UNIX or MS-DOS sense. To me, changing directories means that when you list the directory, you see only names of files belonging to the directory into which you just moved. It is possible, by giving the full path, to examine or execute a file in a different directory in UNIX without leaving the current working directory, as in..

```
% more ~rupp/Documentation/filename
```

That is not changing directories, however, which in UNIX is..

```
% cd ~rupp/Documentation
```

Now you are in the directory called Documentation and can examine the file without using the full path, as in..

```
% more filename
```

I will have to experiment to find out how similar UNIX and ProDos really are in this regard.

////////////////////////////////////\\

    It has occurred to me that I have never included a disclaimer in my

Does anyone know how to retrieve the system date under Apple Pascal 1.2
(128K, Apple][e and/or //c)?

I already know how to access memory locations via variant records, so
all I really need to know is a) where it is, and b) its format.

Thanks,

AWR

     I can offer nothing but good things about the TIMEMASTER
II H. O., I have been using it for almost a year in DOS 3.3 and
ProDOS with great success. I bought mine a month or two before
the APPLEWORKS update came out and had to *unfortunatly* pay $20
more for that feature. However the latest TM II H.O. includes
this option which is very handy if you use APPLEWORKS.

     Being a UNIX user by day and an APPLE user by night I
find it makes the two systems very similar. All of the reviews
I've read in the magazines rate the Timemaster as #1.

Summary: HELP!!!

[]

I have an Apple][+ with a Videx Videoterm 80 column card. The card works fine with Pascal and from BASIC with a PR#3 command, but Applewriter refuses to acknowledge it. Applewriter is written to pick up an 80col card in slot 3. The Applewriter manual lists many recommended cards, to be placed in slot 3, which will give word processing in 80 columns.

For answers to these and many other questions, I once again put in a plug for "Open-Apple", the best magazine for the money ($2 an issue). It's small but packed with info, no adds. In Vol. 1, No. 11 (December '85):

"As mentioned here in October (page 73), Apple's card uses an addressing scheme that is completely different from any other card on the market.

. . .

You read from or write to Apple's card by peeking or poking byte 49283+(SLOT*16).(In hex that's C083+S0, where S is the slot number). You can transfer a sequential group of bytes between the card and memory faster than you can tranfer the same group from one part of memory to another. This is because hardware on the card automatically increments to the next byte. Your program just keeps peeking or poking at the same peephole.

A disadvantage with this scheme, however, is that it's impossible to run a program while it's on the card. Programs must be moved into main memory first. This isn't a major disadvantage, however, since it's _almost_ impossibler to run a program stored in multiple auxilory memory banks, too.

. . .

As simply a storage device, Apple's card is very clever. You can tell the card what byte you want to appear in the peephole by placing

that byte's address in 49280-49282 (+SLOT*16), low byte first. It uses any standard slot except slot 3, which means it works with a II-Plus as well as a IIe. It won't interfere with interrupts as auxiliary-memory RAM cards sometimes do. Nice card. Too bad the auxiliary-memory cards have already set a standard in this area."

Also, on the subject of //c's, here's another little tidbit from "Open-Apple":

"Th UniDisk 3.5 upgrade enhances the Apple IIc. the upgrade, which is free to purchasers of teh UniDisk, involves a motherboard change. The new board has 32K of ROM where before there was only 16. In addition to the machine language code needed by the UniDisk, the ROM includes more commands for the IIc serial ports (including the XON/XOFF protocal that was previously missing, as discussed here last month on page 84). After an upgrade, the ports are closely compatible with Apple's Super Serial Card. The new ROM also includes a miniassembler, like the enhanced IIe.

. . .

The unused cassette switch at $C028 toggles the two 16K banks of ROM on and off (see May, page 39). No switch is available to read the current bank status, however. The traditional ID bytes for the new ROM (see May, page 40) are the same as the original IIc. You can tell the difference by looking at $FBB3. An $FF ther indicates an original IIc, a zero indicates a 32K ROM.

There's lots of magic in the UniDisk connection, too. It's really more than that. Apple's documentation call it CBUS--it's a non-standard high-speed serial connection for "intelligent" paripherals. Peripherals become intelligent when they have a microprocessor and software in them. Subsciber Tom Vier has discovered that inside each UniDisk 3.5 there's a 6502 microprocessor, ROM, RAM, and one of Apple's IWM chips. The CBUS interface appears to allow up to 127 devices to be connected to an Apple II in a daisy-chain--including character-oriented devices such as printers and modems. Isn't that interesting?"

I think it is. I mentioned a while ago that when I was playing with one of Apple's very own //c's I got the message "AppleTalk not connected". Now I think I see why. It seems to me that //c's are going to be Apple's main connection to the Mac. I know that AppleTalk can accept up to 65535 different devices, but that because of software, it could take several minutes to get a unique identification number. I guess that Apple decided 32 was too small a number and 127 didn't take too long. Another tidbit of romour I hear is that the Mac System is getting closer and closer to ProDos. Remember SOS? Looks like Apple has something similar in mind.

Apple also looks like it's going to reduce proces on //e's and //c's. They should be about:

$945---64K //e w/ extended 80-column

$995---//c with b/w monitor
$1245--//c with color monitor.
I assume $1195 for a //e with ex-80-column & color monitor.

also, $299 for the 256K RAM II

Apple will sell more memory for $69 per $256, making 1meg $506. You
could do it a little cheaper yourself.

(these prices from, you guessed it, Open-Apple!)

The //e was the best selling computer in the US retail computer stores
in September (IBM was a paultry third...:-)).

Well, enough informative quoting of Open-Apple. If you're interested in
recieving it, write: Open-Apple

   I have one of the new "Apple Extended Memory Cards" and I am very impressed. Apple did
the right thing when the choose to put it into a regular][,][+, //e card slot. Even
though I have a //e, I am pleased to see the commitment to the older machines. The new
card has 32 RAM sockets of which 8 come filled with 256K chips for $299.00. For about
$75.00 (mail order) you can populate the rest of the board and have a full megabyte. The
card also has a large chip carrier with what looks like a 64 pin package in it. This
handles the address decoding and the firmware. For most purposes it looks like a

PRODOS
block device. As for the operation, it supports DOS 3.3, ProDos, and Apple Pascal (version 1.3 only).

From DOS 3.3 all you do is type IN#n where n is the slot number and the card is set to work like a RAM drive. DOS 3.3 can only use 512K according to the manual. To use the RAM drive just refer to it as drive 1 in slot n.

To use PRODOS all you have to do is use the formatter on slot n and away you go. The signature byte shows that it is a PROFILE device. After loading the system files into the card I typed PR#4 (my card is in slot 4) and in less than two seconds it was waiting for input.

I am waiting to get the new Pascal system so that I can load the entire operating system onto the card and not have to wait for the disk any more.

There are interfaces to the card that let programs like Appleworks use the RAM directly but this is not specified in the small manual that came with the card. I have also heard rumurs about a 68000 card due out from Apple that is supposed to access the memory on this card. (There are no external jacks or plugs on the card so all access must use the slot interface to the mother board.)

Has anybody else heard about a 68K product or a //x machine.

    You shouldn't have any major problems with leaving it on all the time, except maybe a heat problem because you have so many of your slots filled. If the 24 hour stints aren't going to last long - no big deal, but if you intend to leave it that way for the rest of its life, it might be wise to invest in one of the many Apple fans on the market, or perhaps a small muffin fan. I hope this helps

< Oxygen is for people who can't take New Jersey >

It seems the "Apple Superbowl ad" has gone the way of Steve Jobs.

According to the December 2, 1985, ADVERTISING AGE, Apple is one
of several advertisers that have decided not to advertise again
in the upcoming Superbowl. ComputerLand and Cullinet are two
other computer companies that advertised last year, but dropped
out this time. IBM, which bought three thirty second spots last
year, will have only one. Ad rates are up from $1 million to
$1.1 million for a one minute ad.

They didn't say whether Next, Inc., would be advertising.-)

You need to buy an Applewriter pre-boot disk from Videx (~$25). This is the
only easy way to run applewriter on a Videoterm (or Ultraterm).

  The Hayes Micromodem][will work just fine with the //e, however, there
may be some problems with the Microsoft Softcard...I believe that if you have
an extended 80-column card in slot 0, you may have some trouble with it. When
I boot up the Microsoft CP/M disk, the screen clears, and goes into 80-column
mode, but doesn't display anything. The card worked fine on my][+, but it
hasn't worked too well (ie not at all) on my //e...I'm going to see if its
something I'm doing, but I don't think it's me...

All I've heard about the next Apple // is that the case will be the same color
as the //c.   A 68020 coprocessor card would be nice, but it won't mean much
unless they provide a sensible bitmap graphics mode with it.

Maybe an Apple // with a 680x0 processor, Unidisks & Hard disk, a sensible
bitmap and a few Meg of memory will be another of the 'future Macs' Apple's
talking about. That would be a machine work buying, since I could run
Apple //, Mac, and probably even Unix applications on it...

(And with z-80/HD64180 and 8088/80286/80386 coprocessor cards, I could even
run CP/M and MS-DOS applications. Talk about disk format nightmares!)

I have some software that assumes you have a lowercase chip in your
][+, and I'd really like to be able to use it with my 80-col card.
(a ViewMax-80, supposedly compatible with the Videx VideoTerm)

Has anyone modified the Monitor ROM or the Applesoft HOME, HTAB & VTAB
commands to work only with an 80-column card? Monitor ROM changes would
be preferable since I need scrolling window support as well. Thanks.

[yukyukyukyukyukyukyukyukyukyukyukyukyukyukyuk...]

It seems that I'm having a spot of trouble with an imagewriter II and a
//c. For some reason, if I try to print graphics or download a
character set, I always have a line at the bottom. So if I want a
simple line, I get two. I realized after a few reems of paper, that I
had to set the imagewriter to not ignore the 8th bit. I tried what it
said, Esc Z ^@ _ (_=space) but then all I got was strange mousetext
and ignoring of all commands, only printing when it gets a full buffer.

Any ideas? Is it the //c? I ony have the owner's manual, and as we all
know, that doesn't tell me anything a first grade child couldn't figure
out in two minute without the manual :-). Is there an Imagewriter II
Reference manual? The old imagewriter came with a book that at least
told you something.

 You need a patch for the Videx card..I believe that Videx sells a pre-boot
disk for their 80 column card to allow it to work with AppleWriter...It
sells for around $20...

Lines: 22
Summary: check for "APPLE]["

|| In the PROM, my version of ProDos 1.0.1 looks for the words
|| "Apple][", and in the disk drive it looks for a bit pattern in the
|| drive controller card to make sure it is an Apple card.

| Dunno about the disk card check, as mine is an Apple. But the test for
| modified ROMs is indeed probably restricted to a test for the wprd "APPLE" in
| the right place; my motherboard's ROMs have been modified to eliminate the
| lowercase foldover. The first pass I made had "APPLE][" changed, and ProDOS
| wouldn't boot. I changed that text back, and ProDOS came up.
|
| Cheers,
| Dick Binder   (The Stainless Steel Rat)

     Except that ProDOS boots on my Apple][(no '+'), which does not
contain the autostart ROM with the "APPLE][" banner. It does know that
my machine is a][instead of a][+, so the check may just be to see what
type of apple it is booting on (][,][+, //e, //c, ...) which all have
differences in their ROMs.

> something I'm doing, but I don't think it's me...
>
> Benjy Mouse
> University of Illinois

Yup. The person (dare I call him an 'engineer') who designed the
original MS Softcard took quite a few liberties with the][and][+
timing. The Z80 mode got fouled up do to the Softcard mis-calculating
bus acceses. They came out with a fix.

Same thing happened with AE (ithink) and Orbital systems (I know.)
when the //e came out.

For all intents and purposes, the older Hayes MM][s shouldn't work
on a //e. That's why there's a Micromodem //e. You must have
an earlier model.

>(128K, Apple][e and/or //c)?

>I already know how to access memory locations via variant records, so
>all I really need to know is a) where it is, and b) its format.

I could not get through directly do I will post this.

This stuff came from Call A.P.P.L.E. in their About Pascal book. Since the Pascal 1.2 locations were different I wrote a short program that used variant records to scan memory for the date that I had set via the filer. This is the result and it has worked without a problem.
  Pascal 1.3 is now available and once I get my update package I hope that it will be built in. The new pascal 1.3 is supposed to have a 900+ page manual!

Good luck,
Ken Faubel

I have a Rockwell Aim-65 microcomputer for sale. This is a basic
unit that I have used for data acquisition, as a controller, and
as a laboratory computer. The system is fully functional and
includes the following:

Basic unit with 8K monitor in ROM
8K Microsoft Basic in ROM
6502 Assembler in ROM
Custom enclosure
Custom power supply
Full set of Manuals including source code for the monitor
32K RAM

The basic unit has a 20 column thermal printer, full typewriter
style keyboard, and a one line alphanumeric display.

Asking $250.00 or best offer.

>more than that. Apple's documentation call it CBUS--it's a non-standard
>high-speed serial connection for "intelligent" paripherals.

Why not use SCSI or the already existing Mac interface? (especially for
new disk technology where you don't need to be compatible with the old
controller) If Apple sold a SCSI-compatible 3 1/2" disk then I could have
a system with ONE disk controller. Mac-compatibilty would conserve Apple's
hardware development resources, and it also gives you more compatibility
between machines. I guess the NIH (Not Invented Here) symdrome has been
carried over from Apple's old product division structure as well.

>become intelligent when they have a microprocessor and software in them.
>Subsciber Tom Vier has discovered that inside each UniDisk 3.5 there's a
>6502 microprocessor, ROM, RAM, and one of Apple's IWM chips.

You're kidding! That's why they retail for $499 (although mail-order
houses seem to have them for around $250 (w/controller)). Maybe I should
add a terminal to my Unidisk and use it for my second computer :-)

Why did Apple do this? Most people attach their drives to one machine.
If the drive's 'intelligent', will it queue up read requests and have a chance
at running a real multasking OS for the machine? (The disk was always the
bottleneck before.) I'm worried because I remember those 'smart' Commodore
disk drives. What implications will this have for copy protection?

Where can a get an dumb, high-density (>720K) 3.5" drive for my Apple that
I can use under ProDOS and CP/M? I'd even consider building a Mac-compatible
controller or writing drivers if someone has a schematic.

I'm purchasing a new computer system and need to sell my //e.
The system is in excellent condition and includes:

HARDWARE

     Basic unit with double graphics capability (510 x 276)
     monitor stand
     2 apple disk drives
     green monitor

PCPI CPM board with 64K of 6Mhz RAM (CPM programs run fast)
extended 80 column card
Apple Dumpling parallel interface card (used for printer interface)
2 game paddles

SOFTWARE

CPM

Wordstar
umath/usimp
assemblers
utilities

APPLE

Pascal
Visicalc
quick file
games

I have about 100 disks of other misc. programs for the Apple
including assemblers, games, and utilities. The PCPI card can
also be used a s RAM disk.

Asking $1100 or best offer. Please respond before Christmas.

In the curent issue of A+, I saw a hard disk drive advertised that I had not seen before. It is manufactured by AST, and is called the Microstor. Anyone have any usage experience or pricing info on this. It sure looks interesting. Any comparisons to the Sider?

Thanks in advance.

I've just got a Z80 Card for my Apple][and I wanna find out how to use it. I hear there's a book called "The Z80 SoftCard" or "Using the SoftCard" or something like that. Anyways, I want it. None of the 5 or so computer shops I checked-out here in Toronto have it.

Maybe using the card is really easy and I don't need a book. Perhaps
you could just write a-couple-a sentences and tell me all I need to
know.

Thanks-in-advance

December 27, 1985

I would like to interface a U.S. Robotics Auto Dial 212A modem with
an Apple IIc.

Here is the pin-out for the modem:

 2 Transmit Data, terminal to modem
 3 Receive Data
 5 Clear to Send
 6 Data Set Ready
 7 Signal Ground
 8 Carrier Detect
12 Speed Indicate
20 Data Terminal Ready
22 Ring Indicator

Can anyone give me info on how to make a cable to the IIc serial

port?

There are many 2400 baud IBM PC BBS's (Bulletin Board Systems) scattered through out the USA, but does anyone know of some 2400 baud Apple BBS's (or Ascii Express lines for that matter)???? Some of the people have have "spoken" to on Apple BBS's didn't even know 2400 baud existed! Send them e-mail, and I'll post a listing of the better ones to the net. C'mon Apple users, we can let the IBM users beat us out! ;->

In article <215@uw-june> mains@uw-june (John William Mains) writes:
>Wanted: Terminal emulation software with XMODEM file transfer
>protocol for Apple II running the Apple Pascal (UCSD P-System)
>operating system. VT100 emulation would be a plus.

Both of these things are done by SOFTERM 2. It has many terminals as
well as DOS, CP/M & PASCAL. You can emulate a VT100 (I am doing that
now) & use XMODEM on any of those three systems. As a bonus, you
can convert files between any two of these 3 os's. (Too bad it
doesn't also have PRODOS!).
     SOFTERM 2 comes in different flavors for different apple computers
and memory sizes. It lists for $195. The manufacturer is:
     SOFTRONICS, Inc.
     Memphis, Tenn. 38119
     901-683-6850

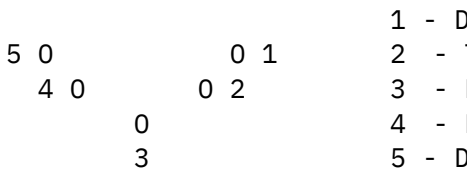
> 8 Carrier Detect (CD)
>12 Speed Indicate
>20 Data Terminal Ready (DTR)
>22 Ring Indicator

>Can anyone give me info on how to make a cable to the IIc serial
>port?

First off, this is the pinout for the IIc's serial ports:



1 - Data Terminal Ready (DTR)
2 - Transmit Data Output (TD)
3 - Power and Signal Ground (GND)
4 - Read Data Input (RD)
5 - Data Set Ready (DSR)

I am always wiring null modems to connect hardwired terminals, and
they reverse everything, but I think (!) that since you are connecting
the IIc to a modem, you just connect DTR to DTR, TD to TD, etc...
You probably have to jumper 1 and 7 on the modem end together and run them
to 3 on the IIc as they are both grounds.

I have an Apple IIe lookalike, and I am trying to use the full 40 tracks that are available on the disk drives. Microsoft has not made this especially easy, as they supply neither the MOVCPM utility nor the source code for the BIOS or BDOS. I beleive that the modification requires only a change in the system's BIOS to tell it that there are more sectors.

From the information that I can dredge up, the system was originally set up for 35 track drives as the inner 5 were considered unreliable. The disk drives that I am using, and the disks I use, are, however, quite good in this respect, and I want to use the extra 14% or so of disk space (I have just the application for it....). Microsoft here in Australia have been singly unhelpful (in fact, as soon as the word "source" was mentioned they became rather abusive).

Has anyone out there in Netland attempted this modification? If so, please send mail to me directly. If anything comes of the responses, I will post a summarised followup to net.micro.cpm and net.micro.apple .

Thanks in advance...
Phil Dimond.

HELP!!!!???????

A simple question to those of you who have used MacWorks/XL
release 3.0. Is it possible to use more than 1 Profile
with a Lisa under MacWorks. I currently have a Lisa 2/5
with revision 'F' ROMs, and that little 5 meg drive just ain't
cuttin the mustard. I am planning on adding another parallel
interface board and a 10 meg Profile (the outside kind).

Basic questions are:

    Can I use both,
    Will MacWorks bring both online at startup,
    Do I need any more hardware other than the interface and the drive,
    etc.

I am not using the Pascal workshop, and I hate to junk the 5 meg drive.

Any answers/suggestions will be greatly appreciated, and as expected
will summarize to the net.

"Thanks in advance", he said.

Rick

I am looking for the following chips:

   CA3146E (High voltage transistor array)
   MC3470P (Floppy disk read amp system)

These are used in an Apple disk drive -- I blew one or both of them when I
unplugged the drive/controller cable with the power on (shiver). Please mail
me if you have either or both of these chips. Thanks.

I use UNIX (4.2 BSD) daily in my work, and am familiarizing myself with MS-DOS. Therefore, when I started to examine ProDos, I expected a similar way of changing directories. But the book I am using, by a guy named Campbell, does not seem to explain how you get from one directory to another. Paths, yes, but I see no "change directory" command, such as cd in UNIX.

Am I totally misreading this fellow's book, or is there no way to move from one directory to another in ProDos? I feel somewhat foolish asking this question, but I simply cannot find the information I am looking for in this particular book.

Thanks

I'm looking for a Native Code Generator that will compile p-code (or m-code, I'm not picky) into 6502 assembly language.

Ideally this program would run on an Apple][under the UCSD P-system or ProDOS, but I would be interested in a system that would run on any

sort of machine. Cost is a consideration, I'd like to get this for <$100.

Anybody out there interested in a 65802 in their Apple? This is a
version of the 16-bit 65816 which is pin-compatible with the 6502,
will emulate a 6502, and will also act as an 8/16 bit processor,
with 16 bit A,X and Y registers, a 16 bit stack register (allowing
for a real stack, larger than 256 bytes), relocatable zero-page
(as many as you like) and a host of new instructions. The major
difference between it and the 65816 is it's lack of a few of the
65816 signals and an address space limited to 64K, rather than 16Mb.
The processors instruction sets are identical.

The processor is from Western Design Center, and goes for $95 in
single quantities. However, I was told that if purchased in
quantities of 25, the price drops to ~$50.

Basically, it should be easy to pop one of these into an Apple
(][or //e) with a minor hardware mod. It would be necessary to
bank switch the monitor ROM with another ROM at power-up, since I
believe the chip powers up in 65802 mode, not 6502 mode (though I'm
not sure. The data sheet is not clear on this and I will find out).
The chip also supports the 65C02 codes, so it will work in those
enhanced //e's (possibly a //c, but you're *really* on your own

there).

So, I am asking if anyone else would be interested in purchasing one of these chips. CAVEAT EMPTOR! I am *not* offering to support you in any way. This is simply an offer for a group purchase/discount. I will give you a copy of whatever hardware mods I plan, but do not guarantee they will work. I'm a little in the dark myself, but it should work (famous last words). More information on the chip can be obtained from:

Western Design Center
2166 East Brown Road
Mesa, AZ 85203
(602) 962-4545

As far as software goes, there are some products available, I know of an assembler from the people who make the Merlin assembler. I believe that anyone starting out at this point would be writing everything in assembler, since I don't think there are any compilers available.

If you're interested, drop a note to me. I'll wait a couple of weeks, but if I can't get enough people togethter by then I may just go ahead and put the bucks down.

Use SET PREFIX. If you think about it, it effectively does the same
thing.

*** REPLACE THIS LINE WITH HELPFUL ADVICE ***

Once again I seek knowledge from non-conventional sources...

I'm using AE pro 4.20, a Hayes Micromodem //e, and an apple][+ with 64k.

When I try to use screen-based software on Unix, like vi (I realize this is
silly at 300 baud. Just take for granted I'm a clod), the apple completely
tweaks out, and leaves garbage on the screen, which vaguely resembles the
desired program.

Can anyone offer advice on how to fix this?

Gary Huckabay

> Paths, yes, but I see no "change directory" command, such as cd in UNIX.

ProDos does not maintain a concept of "current working directory",
but instead maintains a "current prefix" which is prepended to
filenames. This accomplishes much the same thing. The Basic
Language Interpreter supports a "PREFIX" command, which reports
the current prefix if no arguments are used (UNIX "pwd"), or sets
the prefix to the user-specified argument when present. There are

of course Machine Language Interpreter system calls for this.
Unfortunately, there appears to be no built-in equivalent of the
UNIX "cd .." and definitely no concept of a $HOME directory (UNIX
"cd" with no arguments). Fortunately, if the new prefix being set
does not start with /, the existing prefix is prepended to it, so
there is equivalent behavior to the UNIX "cd subdir" (relative path).

If one were to implement his own shell, it would be easy to
implement "cd .." by getting the current prefix, then trimming off
the last piece of it and setting the new prefix to that. This is
similar to what I did in the BRL SVR2 Bourne shell to circumvent
symbolic links to directories. I rather like the prefix approach,
except for its lack of ".." support.

This article was in the latest issue of Electronic Engineering Times.
Although CD-ROM's aren't here yet, they will be shortly.

"A torrent of CD-ROM applications will deluge the computer and consumer
information markets at Comdex in Las Vegas, Nev., Nov. 20-24.

Philips, Sony, Toshiba, Hitachi, Matsushita and Denon are expected to
display improved versions of their earlier, proto-type CD-ROM drives.
Most are configured to work with an IBM-PC host. But SCSI disk emulators

are in the works. They can be attached to almost any contemporary computer system.

Developers are hard at work on CD-ROM applications. They're trying to get CD mastering plants to stop the presses for a while. Just long enough to punch out a few data disks as samples for interested CD-ROM customers.

Dozens of different demonstration disks bouncing around are sure to land at Comdex. They're packed with text, graphics and sound demos.

In January, the U.S. Army should place a contract for 50,000 to 60,000 interactive laser-disk training systems. N.V. Philips hopes to latch onto that deal and produce the laser-disk material wanted. Both Philips and Du Pont spokesmen say they expect educational markets to turn into their biggest base of customers.

Interest in consumer data applications should become very high in January at the Consumer Electronics Show in Las Vegas. By then, the first volume-data 'title' will have been out for a few weeks. It will be the CD-ROM version of the Grolier Excyclopedia. Its 21 volumes are tucked into one-fifth of a 550-Mbyte CD-ROM platter."

Although it wasn't mentioned in this article, Atari has said they would have the final version of their CD-ROM player at the Comdex show too.

Has anybody had any experience with Rana disk drives under PASCAL (or PRODOS). I have
two Elite II drives that I bought about two years ago. I have been very pleased using
them with my Apple //e under PASCAL 1.1 and I now would like to move to PASCAL 1.2
(and 1.3 as soon as I can).

My problem is that Rana has never put out an OS patch for PASCAL 1.2 and since they went
belly up I expect that I am on my own. I was told about a year ago that I would need to
buy their newest PROM (1.4 I think) if I was going to use PRODOS and that any PASCAL fix
that they might come out with would be based on this level of firmware. After spending
$50.00 on the PRODOS upgrade, I now have the new PROM and a PRODOS disk. The new PROM is
supposed to follow Apple conventions for disk controllers under PRODOS and at a minimum let
these drives work as regular 143K drives. The drives will not boot PRODOS and the disk they
sent me was broken. I also had to undo the //e enhancement because it conflicts with Rana's
PASCAL 1.1 patch. The one good thing is that I can use the disks as regular 143K drives
under PASCAL 1.2 (640 blocks is alot to keep track of anyway :-).

My questions are:

1) Does anyone have a working Rana disk for PRODOS?

2) Are there any PASCAL 1.2 (or 1.3) patches available to access the full 320K of the
Elite II drives?

3) Does anyone have any experience with Apple PASCAL device drivers for the Rana drives?

4) Are there any suggestions short of spending hundreds on a hard disk or Unidisk 3.5?

Please send email and I will forward a summary if anyone else is interested.

Thank you in advance.

   I am not familiar with the book of which you speak, but there is a command in ProDOS similiar (but not quite like cd in UNIX). The command is 'path ='.
   The syntax is   'path ='<pathname>. where pathname is the logical pathname of the directory you wish to set. (ie. system/wpfiles)
   Hope that helped.

Here is what to do if your Apple is losing characters as an AE Pro terminal:
Enable your Micromodem to send interrupts to your Apple by installing a
jumper (as detailed in your AE Pro manual). If you want a non-hardware fix,
you can put a screen clear delay in your vt52 termcap and that will help some.
If you do not have interrupts enabled, then your modem will send signals to
your Apple that get lost in the shuffle (i.e. part of the screen-clear
sequence in the case of a vi startup), even at 300 baud.

A routine to do this has already been written, in fact, I am certain you have it in your library. Where??? Why right on your DOS 3.3 system master. It is loaded automatically along with Integer Basic when the disk is booted. (You need to have a 16k language card in slot 0) Just type INT to get into Integer basic, call -151, and the commands will be present. The 'S' command (optionally preceded by an address) will single step a program, the 'T' command will do a trace. You can find more information on page 52 of the old Apple II reference manual that came with your II plus. By the way, this info also applies to Apple IIe's and Apple IIc's. Those with old Apple IIs with integer in ROM have it even easier-- they have these routines present as soon as they power up their machines. In case you're curious, the trace and step commands were deleted from the monitor ROM to make room for Applesoft, since Applesoft is much bigger than integer.
Hope this helps.

hello networld!

I just got finished taking down five apple //c's for a big conference
we're having here at Reed college, and I typed pr#7 just for kicks.

I got the message 'appletalk not connected'. I assume they have the
latest ROM mods (They came from Apple direct), so I guess included with
the package for the 3.5 inch drive also gives appletalk capability.

Has anyone heard official word from Apple about this? One of my
roomates has a //c and she's interested in the 3.5 inch drives. Is it
also true that there's no way to use a Sider with a //c?

Also, I am looking for a Kermit for an Apple //e, 80co board, ssc, and
ASCII Express Pro. I've got all these silly little text files on the
Vax, and I want to download them and edit them with applewriter(Dos 3.3
version, of course). Anyone have one?

By the way, as mentioned earlier, prefix <path> is the ProDos command to
set paths. A really good source of information on Dos 3.3 (The good
dos) and ProDos (The fast dos) is _Beneath_Apple_(Pro)Dos_ by Don Worth
and Peiter Lechner. These guys are the best. If you decide to buy the
ProDos Reference Manual, beware! It has false info. It seems that in
early versions of ProDos, there were routines to split applsoft programs
around the High-Res screens. As PorDos grew, these routines had to be
removed due to lack of space. It seems, however, that the manual had
plenty of space, and no one took the discriptions of these features out

of it. . .Oh, well. This may have been changed with newer versions of
the Tech Ref. I don't know.

We have the following Apple II+ system that works fine but is just
setting around doing nothing:

Apple II+ with 16K ram, Videx 80 column card,
                 Thunder Clock, Microsoft Z80 card.

System Saver fan, Sanyo green screen monitor.

Corvus 20 meg hard disk with mirror backup, and constellation
includes 3 controller cards.

3) 7710 serial cards

Apple II+ not working (will fix, only has bad chip)

floppy drive.

Qume Sprint 5/45 letter quality printer

SOFTWARE INCLUDES:
DOS 3.3, PRODOS, CP/M, UCSD Pascal
Accounting + (have both 5 1/4 and original 8" disks (CP/M)
Multiplan
dBase II
Manx C compiler
softterm II
much much misc public domain and non public domain programs.
UNIX tools (can't remember exact name but is a commercial package)

WE **NEED** TO MOVE THIS OUT YESTERDAY SO WILL CONSIDER

ANY AND ALL OFFERS.

If you need just part of it, you may want to bid on the whole thing
because its going to move cheap. OVER $16,000 worth of equipment new.

> the monitor?

The old monitor ROM included this feature. If you know someone with an
old reference manual, you can copy the program (the part that's not

included in the autostart ROM is not all that big). If someone has
done this already, they may want to post it to the net (if that
doesn't break any copyright laws).

I recently posted a message about apple kermit.
I got some reply talking about the same request as me.
I have a Kermit for Apple with Micro modem//, since this one is a
binary code, I can't modify to adpat it with my Super Serial card.
So, if you are interested, give me a mail
Send me with your post address and take the risk of the program yourself
because I never have chance to test it.

Ok, I know this is probably an old question that was discussed long ago.
But it is only now that I have some friends running PRODOS, that I
would like to be able to. DOS 3.3 always served me well and I use CP/M
most of the time anyway. So, if you know the answer and could take a
minute to send it, I would appreciate it.

Does anyone know:

     where Teknika monitors are sold?

retail stores where they may be viewed?
(hopefully locally, but anywhere is fine)

how compatible is the MJ22 with Atari, Apple and IBM?
(for computer upgrading without new monitor requirement)

information on servicebility and/or reliability of them?

Thanks in advance, --Bill--

Has anyone out there been able to successfully use the computerized traffic generator program written by Bob Fink in the Februrary 1984 issue of Model Railroader magazine? Either as written in Microsoft BASIC for the TRS80 Model I computer, or translated into Microsoft BASIC for Apple, Microsoft BASIC II for Atari, etc.? I am trying to translate it from the original to Atari Microsoft BASIC, and am not having much success. I question whether the program as written in MR will even run on a Radio Shack TRS80. I have found what appear to me to be several fatal programming flaws. I would appreciate any help from any other model railroaders working on this. Thanks in advance.

Get yourself a 16K ramcard (if you haven't one already) and boot it up.
That's all there is to it.

I know for a fact that ProDOS 1.0.1 works on a][+ w/ 64K (that's what I got).
I'm not sure about 1.0.2 because I don't think I bothered getting the update
yet. Some disks might not work however, like the //c System Utilities disk.
I think that only works on //c's and enhanced //e's. Bye.....

Hmm. Maybe tha's how I could use the //c System Utilities disk. But alas,
it probably uses 128K anyway. Oh well. Hope this helps.

     card for above
 (1) Taxan RGBvision III monitor (digital, 640x262 res., .38mm dot pitch)
     which also says "Acorn Computer" on the front (for above with an Apple //)

Features and other stuff:

  The Apple //e CPU has been upgraded (by the dealer) in the following ways:
It's got a revision B motherboard, a revision B keyboard with an uncharacterist-
ly good feel for a //e, and the 65C02/ROMchip/char_gen upgrade

  The re-arranged in Disk][means it no longer has a write-protect sense,
but rather a homemade switch. I'll part with it cheap.

  The IDS 480 Microprism is a sort of fast (80 cps/110 cps) printer which was
the first to have a real correspondance mode, and looks better than some of
the other correspondance modes you'll see- I'll send you a copy via USmail
if you like. The Grappler+ is your standard control-I and dump Anything
printer.I've got the pinter working with Applewriter //e 2.1 and Appleworks.

  The Video-7 card is just like an ext. 80 column card, making this a 128K
computer. The Apple //e graphics (even double-high-resolution) cannot do justiceto
the Taxan monitor.

Also for sale:

Mockingboard C sound board (uses 6522 versatile interface chip, has 6 pure
                            tone channels divided three into left and right,

two noise generators, and the really amazing
SSi 263 (as seen in Byte) speech synthesizer
chip on board. With much software.)

And a lot of disks full of interesting creations.
And software.

(Like Music Construction Set comes with the Mockingboard, and I am selling
 TNET 2.0h BBS software.)
telephone: 1-201-464-5269, after 3pm, ask for Dan.

My brother has an Apple IIC and is generally quite happy with it.
He is now looking to buy some more exciting boards and use them with his
computer. Boards like speech I/O, household minders,etc,etc.
He has discovered(of course) that the IIC is fine but NOT expandable.

He was told (By Apple) of the existence of a company called :
" SICO Consumer Electronics " .
They are purported to make a Apple IIC to Apple IIE convertor.
This would allow you to have a chassis that you could populate with
Apple IIE cards and cable over to your Apple IIC .

Sounds like a good idea...

If anyone out there has any info on such a beast please let me know.

Thanks,
Todd Basche

I am having trouble using kermit to transfer files between an Apple
IIe, and UNIX. When I try to send files from UNIX to my Apple, all
occurences of the "&" (ascii 38) character are removed. This happens
in both the image and text mode. However, all goes ok when I transfer
a file from the Apple TO UNIX. Does anyone have an idea what is happening.
The Apple has a Super Serail card if that helps.

Thanks in advance.

If I remember correctly, Trace and Step were taken out of the F8 ROM to
make room for the Autostart capabilities of the II+.

Oh.. I guess I'll have to quit using Prodos on my old Apple][:-)
Really, Prodos can be used on Apple][']s and][+']s with "Language
Cards" (16K Ram cards). However, since Apple][']s have Integer
Basic in ROM, and Prodos only supports Applesoft Basic, Apple][']s
(not][+']s) running Prodos cannot support Basic (no great loss ;-).
I have been using EDASM under Prodos for quite a while now, and am

pleased with it.

I understand that Rana Systems is no more. Does anybody know if any
company is going to take over support of Rana products, and/or will
Rana rise from its ashes like Osborne? I am particularly interested
in getting a Prodos update for my enhancer disk, and if Rana is out of
business for good, can I get schematics of my Rana controller and
disk drives so I can repair them myself? Rana made decent products
(particularly compared to the junk that that their competitors such
as MicroSci put out), and it is a pity to see them go.
     Also, can somebody send me some information on the Mountain
Computer Clock Card for the Apple? I especially want to know how to
set up timed interrupts using the clock (I have this dream of multi-tasking
DOS). Can somebody send me the address of the company that makes this
ancient piece of hardware (it says copyright 1978 on the card).
Thanks.

Summary:

*

At least on the Apple II+, the hardware looks like a Datamedia. CP/M 2.2 does a software translation from a Soroc IQ-120 lookalike to the Datamedia control codes. So CP/M looks like a Soroc. Under DOS 3.3, try telling your program that you are a Datamedia, and see if that can be recognized.

   In order to allow people who do not know assembly
to write interrupt code for a data aquisition system
I am trying to set up a system whereby (actual
(slow) hadrware) interrupts can be written in applesoft .
It is important that this code use the same variables
as the main program (so don't suggest using the two
address spaces of the IIe/c) .

   I've tried a simulated CTRL-C with an onerr in
the main program , but was foiled by the microsoft

HAPPY-CODE (not to mention needing a ramcard
which is undesirable) . My current version maintains
a second zero page for the interrupt (except for
pointers to variable space) , and the interrupt
applesoft sits elsewhere in memory . I am having weird
but persistent problems with this scheme and am looking
for suggestions as to what they might be , or viable
alternate methods .

As a side note:

     I'm running the latest version of ProDOS on my Apple
][. (Serial number 18033, circa 1978) It works fine. No problems
whatsoever. (That is if you have a 16K ramcard & Applesoft)

<Chomp chomp>

Does anyone happen to know how the Lisa keyboard works, ie what signals
go over which wires? In particular, I'm trying to figure out how to
hook up a Lisa keyboard to an Apple II+. The II+ has a 7-bit parallel
ascii-encoded keyboard interface. The Lisa's plug is simply a standard
1/8 inch stereo plug. The keyboard didn't include any documentation
on how it works. Any help would be greatly appreciated!

I don't know about the conversion, but I do know that several third party vendors do make expansion cards for the //c. They include a Z80 card, a memory expansion card (both from Applied Engineering), a speech/sound synthesis card from the guys who make the mockingboard (called the mockingboard c) and I believe a 65816 or somesuch number microprocessor board from (I think) Legend. I'm not sure, as I don't have the advertisements here. You can look them up in any magazine that has flashy advertisements, such as A+, InCidar and Nibbles (For real info, try Open-Apple). You will find that there are several makers of these boards.

Also, I hear tell, from semi-reliable sources whom I cannot recall right now, that Apple _may_ honor warrenty repairs on //c's that have these third party upgrades. Apple finally learned that no matter how "closed" their architecture is, _someone_ will do something to improve it.

I have no connection with anyone mentioned here except myself, and I'm sure many of the names are trademarked.

   error : I forgot to mention that I do in fact also swap
the stack and the processor registers (stack
pointer included) .

   One weird bug is that if the interrupt prints
a string out n characters long while the main
program is waiting for input , then applesoft
reads the current line as n characters long .
Does anyone know of the existance of a second input
/output pointer ,(perhaps in dos) that might cause
this .

INCORRECT!!!!

I can run MousePaint on my][+, and MousePaint is a ProDOS program.
Even dealers are confused about this, it seems.

Now there are some programs, like GATO (submarine simulation) that
make use of the auxiliary 64K memory available on the //e & //c,
but ProDOS does not require this extra memory or double-hires,
so it WILL run on a 64K][+.

Now hold on just a minute. I've had Micro-Sci disk drives for three years right
now and have had no problems whatsoever with them. At the time I purchased
them, they were half the cost of an Apple drive and at least $50 cheaper than
Rana's. My high school has had Micro-Sci drives for years without having any
problems; their Apple drives need speed adjustments every couple months or so.

I never had much luck using the Rana drives, as they're really not very

compatible, particularly with copy-protected software. I would suggest to the author of the above that he choose his words more carefully next time.

>][e and][c can operate prodos. Your friend will have to settle
> for good old DOS 3.3 any other questions on prodos let me know

I purchased a copy of ProDos from my Apple dealer, for about $50.
And it runs just fine on my Apple][+.

ProDos is designed to run in a pure Apple][+, it will not boot in
an Apple that has had modifyed proms added.
In the PROM, my version of ProDos 1.0.1 looks for the words
"Apple][", and in the disk drive it looks for a bit pattern in the
drive controller card to make sure it is an Apple card.
While looking at the disk controller it determins if there is a ProFile
 or if it is a 5 1/2" disk drive.

ProDos can be modifyed to boot on just about anything.........
Once I brought it up on my Apple][+ I modifyed it to run on
my Franklin and on my AVT-2, both of which run Apple Software.

So the answer that ProDos can only run on (in) a][e or][c is false!

Well, ProDOS (for the Apple //) can read SOS Text files, so your problems should be solved if you can get find an Apple // running ProDOS. Then you should be able to upload the file from an Apple // a bit easier.

I heard that there is a UNIX system, like Source and Compuserve, is a time-sharing system. The name is probably called The Solution. Is there anyone familiar with it? I want to join this one in order to have full access of the networld. Could you give me some advises?
Also, I ask this for my friend," Is there any cable which can connect a modem or how is the configuration pin outs about the serial port for a //c?
Sorry folks, I received a lot of mails concerning my previous messages. But, I can't send the mail because of the priority here. Thanks to all of those who kindly answered my questions. If you want me a reply, give me your Source, Delphi or Compuserve user name if you have one, I have accounts in those systems.

I downloaded a Kermit from Source, but it's not working.
It runs on my Apple, but doesn't recognize my Super Serial card.
When it's fixed, I will post it here if I can. (I may get complaints
because it's about 64K in text format.)
Also, have you heard of Viewtron?
See you.

    There has been some discussion lately about replacing 6502's in
Apple's with 65802's. I don't understand what this accomplishes. Is
the 65802 faster? If so, how does the rest of the computer keep up?
Someone mentioned that there are many extra instructions but you can't
use them unless you are programming only for yourself (and perhaps the
very few others who have also made the upgrade). Am I missing something?

I didn't see the ad, but I thought the price was $695 + p&h.
Anyway, I have a coupla friends with siders and they like them.
Also, I've read reviews of them (A+, don't remember the other) that
were pretty good. The best way to make up your mind is decide whether you
want to deal with a mail-order only company. Cheap, but returns are slow.

I also heard that the support for them is good from the company, i.e. quick
replies to the questions you ask.

                        dave

% ps -a ; let's hear from those that do have siders.

Summary:

I don't have access to info-apple but I have yet to hear anything bad about
the Sider. There is a bulletin board in Albquerque(sp) that has a Sider and
the only trouble they have is with 1200 baud modem that they have been trying
to install.

Anybody have a sider that wants to clarify this? I want more storage but
would like to avoid 3 inch disks. Are siders reliable?

Hello, Ok, there have been some problems with The Sider

Hard drive, however, there have been about 15 reviews,
and all of the Reviewers loved it...(Incider, Creative
Computer, etc)...It is true there are problems, but
it does have a warranty, and if you find anything
wrong with it, it's best to send it back and get a
new one while you're under warranty, thus, if you
keep it up, you should eventually get a great one...

To trap out Ctrl-c's, all you have to do is use an
ONERR GOTO command somewhere in the beginning
of your command...the control c will be interpretted
as an "error" and will send the program to whatever
line number you told it to GOTO.

  I use the Apple Access II software for my communication needs.
Up until recently those needs have only been to communicate
from home to the main-frame computer at work. When I want to
download a file into my apple, I open a recording file in Access
II and tell the main frame to concatenate (cat in UNIX) the file.
I am now exploring the world of Bulletin Boards. Most seem to
use various forms of data exchange protocol like XMODEM or
XMODEM/CRC. Access II uses Christensen (sp?) protocol. I have
been told that XMODEM and Christensen protocols are the same.
Is this true? What's the difference between XMODEM, XMODEM/CRC
and some other popular protocols? I have used Christensen protocol
between two Apples and it works fine (slow but fine).

          Thanks in advance.

Has anyone done any assembly language programming using the ALS Smarterm? I cannot find the current address of the company, if they are still in business, and no one around here has one also. I am particularly interested in the memory locations necessary to address the screen directly without having to uses the on-board roms.

Thanks to everyone who replied. After MANY hours of tinkering, I have finally found a solution!

Hardware side:
There was one MAJOR hardware problem: NO WHERE IN THE ACCESS II DOCUMENTATION DOES IT MENTION THAT YOU MUST ENABLE INTERUPTS ON YOUR APPLE SUPER SERIAL CARD! I view this as a consequence of Apple's idea of documentation. After enabling interrupts, my Apple no longer lost characters (real improvement!).

Software Side:
Using Apple Access II, I modified my vt52 termcap by adding delays to three commands: 200ms delay to the cm (cursor movement) command, 200ms to the sr (scroll reverse) command, and 10ms to the ce (clear to end of line sequence) command. It may be that 200ms is overkill on the delays, but I haven't had time to tinker with exactly how much delay is required. I still have a problem with vt100 emulation, but I'm sure this can be solved with a few delays added to that termcap. I set up the Access II terminal characteristics to use vt52 mode, 8 bits per character (not sure this makes a difference), no LF after a CR, and NO wraparound (makes a difference with vi), all other settings were left at defaults.

Another solution that works (but not quite as well) was to use Ascii Express Pro in Soroc emulation mode (a slightly enhanced ADM-3A). Unfortunately AE Pro does not do reverse scrolling on the Apple screen (which Access II does). Once again, you must enable interrupts on your serial card. A real plus to AE Pro is its ability to work with a large variety of serial cards - Access II ONLY works with the Apple Super Serial Card (but thats Apple for you). AE Pro is also easier to use with respect to setting up auto-logon command files - Access II requires a separate text editor ("Just use Appleworks" they say @#%$!!!). However, Access II is certainly easier to use right out of the box - if everything is configured of course! AE Pro comes in DOS 3.3 and Prodos versions. AE Pro works with all Apple II machines. With the Apple IIe, max baud rate is 4800 (possibly a problem).

If you really NEED vt100 emulation, the best solution is Softerm 2 from
a company called Softronics. It is expensive ($195) but it includes an
external keypad, GUARANTEES 100% vt100 emulation (30 day money back
guarantee), and according to a response from someone at Tek, it WORKS!
I haven't tried it, but that guarantee makes it tempting. The phone #
is 901-683-6850. It appears to be available for all Apple II machines.
Max baud rate is 9600 baud.

Note that Apple Access II does NOT work with Apple II's or Apple II+'s.
It also runs only under Prodos. It claims a max baud rate of 9600, not
tested however.

Thanks again!

There are many fixes. I'm running 80 columns on an Apple][(CIRCA
1978) I'm using a program I wrote myself. It will soon be running on
the Apple //e. It does a COMPLETE VT100 Emulation with ANSI line
editing built in. I'm really strapped for time, grades come first.
I will post an announcement to the net when I get the screen driver
for the //e running.

P.S. In the regular "BBS" dumb terminal mode, It DOESN'T DROP A
SINGLE CHARATER.

I use Ascii Express on my apple II+ with an ordinary 80 col. card.
I was experiencing a similar problem: whenever vi cleared the screen,
I would lose the next 20 characters. Instead of trying to change my
hardware, I finally figured out how to change the TERMCAP to fix the
problem.

Look in the documentation for TERMCAP for how to insert delays after
clear-screen, return, and line-feed. This will slow down your
throughput a bit, but it's worth it to fix the problems without
throwing away your //e 80 column card.

Actually, the command to insert a return/linefeed delay is in tset.
This means that ALL cr/lf sent by unix, not just those programs that
use TERMCAP, will have a delay. This is probably what you want.
Look in the tset, or maybe it's stty, docs. Yes, maybe stty. (sorry
I'm not absolutely sure about anything!)

To do the clear screen delay, you will need to modify your termcap
by inserting the number of milliseconds of delay you need before the
screen clear character sequence (the sequence :cl=^L: should become
:cl=300^L:) - I used 300 which seemed to be about the minimum.

Modifying the termcap is more complex than you might expect. You
need to first copy the termcap info for vt52 or vt100 into a file
(using, for example, printenv TERMCAP > tcfile ... or
grep vt52 </etc/termcap >tcfile) Once you have that file, set the
environment variable TERMCAP to point to that file: for example,
setenv TERMCAP ~/tcfile. You can modify the file tcfile to include
the screen clear delay.

I hope this somewhat twisted advice helps! Good luck...

Oh, a possible hardware solution: get a modem or serial card that supports
interrupts. I can give you information on how to modify your card for
interrupts, if it's one of the ones in the Ascii Express manual. Oh,
Ascii Express is the only software that supports interrupts, as far as
I know.

Am currently writing this letter, via my Apple //e, at 1200 baud,
with Apple Access II, with no problems. Try using an 'ansi' tset.
Apple Access does not do an exact VT100, it implements the ANSI
terminal commands, of which the VT100 set is a superset. What can I
say? It works for me.

In article <475@dadla.UUCP> you write: (deleted for brevity by Dale)
Dale,

     you can use your super serial card at 1200 baud quite
effectively using Ascii Express. All you have to do is turn ON switch
6 of block 2. This will enable interrupts. Ascii Express will
recognise this, and no longer lose any characters. Also, Ascii
Express will work fine in 80 column mode in this configuration with
the regular APple 80 column card in your //e. I am not familiar with

Apple Access II, but I don't think it can use interrupts - at least
if its anything like Apple Access III.

Anyway, I hope this helps!

On the Apple //e, the 80 column card supports interrupts, and does not lose
any characters at higher baud rates. I am currently using ASCII Pro on
a //e, emulating a Soroc 120, running at 4800 baud.

However, I have on order Softerm2, which will emulate a vt100 and other
(hopefully more capable) terminals.

Sorry for the delay in replying, just got my Softerm up and running today,
did not want to respond prematurely.

Got this from my local dealer, who had to order directly from Softronics.

Softronics
3639 New Getwell, Suite 10
Memphis, TN 38118
901/683-6850

Am emulating a VT100, can go up to 9600 baud. It really is as good as I
expected. Reads and writes CP/M, DOS, and Pascal files, too. Be sure to
get Softerm2, 128K Apple //e version. There is apparently a 64K version
that does not do as much.

My housemate's //e runs as a vt52 fine under ascii express. All you need to do is make sure that you tell AE that you are using a //e. If you let AE figure it out, the apples scrolling routines will be used. As far as I know versions <= 4.20 have this feature.

Summary:

In article <557@ihlpm.UUCP> terry2@ihlpm.UUCP (t. nelson) writes:
>I am now exploring the world of Bulletin Boards. Most seem to
>use various forms of data exchange protocol like XMODEM or
>XMODEM/CRC. Access II uses Christensen (sp?) protocol. I have
>been told that XMODEM and Christensen protocols are the same.
>Is this true? What's the difference between XMODEM, XMODEM/CRC
>and some other popular protocols?

XMODEM describes how each individual block is sent. Ward Christensen is XMODEM protocol with a particular description of block 0, and the fact that the other blocks are data blocks.
I will post a (technical) description of the protocol if requested.

CRC stands for Cyclic Redundancy Check. It is a complex form of checksum.
I would assume that XMODEM/CRC is just an XMODEM that outputs the CRC after

transmission.

I was an associate sysop on a BBS in Davis for the summer (Aves: (916) 758-2314)
and we used a Sider with good success. Seemed very reliable except for one
crash; another Sider user advised us to stick to smaller volumes (140K).
Apparently he had been using large sizes (400K) and encountered MANY
crashes.d As soon as he cut down the volume size the problems disappeared.
We haven't had any problems since then either.

Considering dealer cost for just a 10M hard drive is ~$200-250, the $595
price isn't outrageous. We got the Sider through mail order also, but I
don't know the company.

Hope this helps somewhat...

Ok, here it is: Ward Christensen wrote the XMODEM protocol with CRC
checking...(Cyclic redundancy check), so that I beleive that all of
the protocols you just mentioned are the same.

Christiansen=XMODEM=XMODEM/CRC

How's that?

> Can someone out there confirm this architecture failure on the][+ ??????

First off, the word interrupt has 2 r's. Now then, although I don't exactly
understand your problem as stated, I will give you my knowledge on
6502 interrupts. NO REGISTERS ARE SAVED FOR YOU!!! Yes, you must
save all of the registers yourself and restore them after the "rti"
(return from interrupt) command. I don't consider this an architecture
failure.

later...

I might as well put in my two cents worth about the Sider. I bought one in July 1985 -- I've had it for about 5 months now, and have yet to see a single flaw. I have had no errors in either DOS or CP/M. The drive is relatively fast, and I see no problems with it. I would like to hear from some of the people who claim that the drive "is a piece of junk", how about some evidence? I will certainly admit that it is not THE BEST -- but think about it: Is it possible to have "THE BEST"? Certainly not when technology keeps progressing; the best keeps getting cut down by something better. To whoever it was who posted the message stating that the "Unidisk" has "better" (forgive me if this is not the correct wording): In a few months, a couple years at most, your Unidisk will be as worthless as you seem to think the Sider is. I.e., be on the lookout for CD-ROMS. We're talking gigabytes on a 12-inch disk.

I'm using an ancient II+ under DOS and CP/M. It does what I need; so what if I don't have the best hard drive? I'm content with the Sider. No problems, I'm not complaining. Not the best, but good enough for me, especially for $695 (now $595 for a limited time I believe).

This is not a flame. Sort of. Someone wanted input from Sider owners; that's that I am providing.

>

Unfortunately, this is a little misleading. Applesoft BASIC will
leave a bunch of awful stuff on the stack when it jumps off to the
error handler. This will cause terrible problems if you try to use
the RESUME statement that apple has build in. In one of the early
Applesoft BASIC manuals, there is a small assembly language program
that you can call to clean up the stack. This may solve the problem,
although I have never trusted it. There are also some locations in
zero page that hold the location of the command that was being
executed when the error occurred, as well as the stack pointer and
some other information. These might be useful... Again, I don't think
it would be infallible. The best scheme is to initialize your stack
and restart the program if there is an error. Something like:

```
10 ON ERR GOTO 10000
     ...
100 REM Main Program
     ...
10000 CALL 59415 : GOTO 100 : REM Call stkinit and restart the program.
```

I hope this is a help.

[What bug?]

     Before I take the time to work on making a text pro-
cessing system of some sorts support my Apple DMP, I thought
I would shoot a query out to see if anyone had already com-
pleted a similar project.

     What I would like is ANY version of a (nroff || troff
|| TeX || ??) driver that has been written/changed to sup-
port an Apple DMP or Apple Imagewriter printer.   I know
about the nroff driver for the C-Itoh Prowriter printer, but
it's not 100% correct for a DMP. Has anyone modifyed the
'code.itoh' source under nroff to support a DMP/Imagewriter?
Does anyone have anything that supports a DMP?

     As always, thanks in advance. Please MAIL responses as
I will summarize and post back into this newsgroup if
interest warrants; if not I will mail a summary to anyone
requesting it.

Hi everyone, Ok, since I'm the one who started it all, the Sider is
on a Christmas sale for $595 only until December 31. I called
First Class Peripherals and asked them about the problems they've
been having and they said that it was a problem in the old winchester
drive mechanism, and they are using new mechanisms now that eliminate
the noise problems (and probably the crash problems). Their return
policy is 50/50, you pay for the postage to send it back, they'll pay
to return it to you. With the one year warranty, its a pretty good deal.

I also found out about a new 20 Megabyte Sider for the Apple // series,
and it's on Xmas sale for $895, call First Class for more details.

>
> ==========
> David L. Smith

How about putting a cache memory on the board too. (about 256K should
do the trick, I would think (:-), but seriously, at today's memory
prices, why not!?) There are boards available that do just that with
a 65C02 running at about 6MHz (They claim a 3 to 1 speedup, anyway)
But they use high-speed static ram (about 8K, I think I remember
reading) for the cache. And indeed, they do slow down when accessing
the video memory and the IO block between C000 and CFFF. Still, why
not put a *big* chunk of memory at addresses above (say) 2MB, that
can be accessed fast by the 65816 and only make it slow down to
access the low order 128K that it shares with the 6502. The logic of
putting it above 2Meg is to get it out of the way of things like
RAMWorks or Slinkey, if some way can be worked out to allow the 65816 to
access that sort of memory directly. (Probably not, probably have to poke
soft switches just like everybody else. But it's worth a try! I say.)
Does anybody know enough about the IIe MMU chip to say one way or
another?

I think it has possibilities!

Check the latest issue (or maybe the one before) of Call A.P.P.L.E
for an article about the speedup card. I'll bet the people who make
that card could be talked into bringing out a 65816 version with only
a little prodding. (Unfortunately, I forget the name of the people
who make the card, and I cant find the article right now. I'll post
that info though, when I can find the article.)

We need to move ascii data files from an Apple II+ to a VMS VAX.
I'm told that XMODEM which runs under Apple II Pascal is what we
require. We have a Micromodem II. Does anyone know where I can
get XMODEM?

After following this conversation on the Sider and 3.5 floppies, I began wondering what other alternatives there are to these. Is there anything else (for a reasonable price) that should be considered?

The apple monitor saves the ACC in location $45 and then uses the ACC to
decide whether the interrupt was an IO interrupt (in which case it
wants to jump to the user vector) or a BRKPT interrupt (in which case it
wants to jump to the monitor break routine).

   ******* IT NEVER RESTORES THE ACCUMULATOR FROM THIS USAGE *******

That is where the 18 or 8 is coming from - its the top of the stack, left
shifted by three bits. The end of the interrupt code should look like:

```
        ...
        ...
        LDA $45
        RTI
```

or else the mainline code's accumulator gets trashed...

Manx has an Aztec C for the Apple. I'm not sure if they have PRODOS
support, because I used it a couple of years ago, but they might.
I didn't actually use the native Apple II compiler - I used a cross that
ran on a PC. I was quite happy with it, as I've been with Manx in
general. C is hard to do on a 6502 (it has just a 256 byte stack), but
they've done a nearly complete K & R (missing only bit fields, which they
may have implemented by now). Their technical support people are always
helpful (though the line is always busy).

They're at:
     Manx Software Systems

     Just a little bit more info (with the caveat that I'm working from memory): When you take an interrupt, the X and Y regs are preserved, and the A reg is stored at (I believe) $45. What I generally do is immediately grab the A reg from $45 and push it, followed by X and Y. As I recall, the pc and status word are already on the stack when your interrupt handler takes over. If you need more detailed info (like what order the hi & lo pc and status word are in), mail me or post and I'll look it up.

                            Hope it helps,
                            Karl

Gad, if people don't know what they are talking about, they should
remain silent.

The Christensen Protocol is named after Ward Christensen, who developed
it in the late 70's as a file transfer protocol for cp/m microcomputer
systems. It consists of blocks of data prefixed with a simple header,
and suffixed with a check sum.

In its original form, each packet consisted of the ascii SOH (01 hex),
followed by an 8-bit block count and its complement, 128 bytes of 8-bit
data, and a single 8-bit checksum.

Note carefully that there are some clever things going on here: The sum
of the three header characters is always zero, so that it doesn't matter
if you include them in the simple checksum or not. Also note that the
data block is 128 bytes, which is the size of a cp/m logical disk sector.

Timeouts and ACK/NAK responses are also specified.

Later extensions to the protocol replaced the trailing checksum byte
with a two-byte (16 bit) CRC. Most programs implementing the
Christensen protocol accept either checksum or CRC at operator request,
and send whichever was requested by the receiving host.

``MODEM'' and ``XMODEM'' were the two programs developed to speak this
protocol originally. Modem was the manually operated program; xmodem
(named for, I'm told, eXternal Modem) was the remotely operated slave.

Lots of other programs use this protocol; literally dozens of them are
in current circulation. There are variations that use larger
blocksizes, automatically insert file names for batch transmission,
windowing, etc. All are outgrowths of Ward's original programs, at least
in the protocol they use. Adaptations have been made for non-cp/m
systems and for other uses than file transfer (I even made one that
spoke SMTP for mailing). I know of versions for just about every one of
the popular microcomputers, for unix, for vms, etc.

A complete specification of the protocol was recently circulating on the
net; check back a few weeks in your archives.

Disclaimer -- I do not own one of these things (That I am about to describe). All I have is sales literature and a conversation with a (semi) technical sales rep on the phone. Nevertheless, it looks interesting. I have no other connection with Space Coast Systems, Inc.

Having gotten that out of the way, you might want to take a look at the 'Challenger' from Space Coast Systems, Inc. of 301 S. Washington Ave., P.O.Drawer 2767, Titusville, Fla. 32781-2767 (Phone (305)-268-0872)

It is an 'internal' hard drive for the IIe(??!!?) It is a 3.5inch 10Meg hard-drive that comes integrated (inside the same box) with a beefed-up powersupply that replaces the powersupply that is already in the IIe console. (They claim that this makes the IIe 'truely portable' - just leave your floppy drives behind. I don't know how 'portable' my IIe would be under those circumstances. It's still *heavy*!) The powersupply/disk combo has a pigtail with a card attached that plugs into slot 7 (or any other slot [except 3], as long as you don't insist on being able to boot from it.)

The sales person said that it retails for about 1200 dollars. There is also a 20Meg version that retails for about 1600. They claim to have (Real Soon Now?? I don't remember whether they said it was available at present or not.) a streaming tape drive that daisy chains off the disk (doesn't take up another slot) and retails for 2000.

They claim to have software drivers for DOS3.3 ProDOS, UCSD Pascal, and CP/M. The salesperson said that currently, there is a driver for the Microsoft CP/M card, and one "in the works" for the ALS CP/M card, but none

for the PCPI Applicard.

Those prices are quite a bit higher than the Sider. For what that's
worth.

I am negotiating with them to get a demo for the Amateur Computer Club
of New Jersey. I'll report back after I have seen the demo.

In a II+ the monitor code that "catches" the interrupt uses the areg to
determine if the interrupt is hardware or a break insruction, as a result
the areg gets trashed. The good news is that before the above test is made
the areg is saved in location $45. The bad news is that the areg does not
get restored from $45 on an RTI, you have to restore areg with an LDA before
the RTI.

My disclaimer: I am reciting this info from memory, and it has been a while,
so some of the nitty-gritty details may be incorrect.

In article <829@psivax.UUCP> tommie@psivax.UUCP (Tom Levin) writes:
>NO REGISTERS ARE SAVED FOR YOU!!! Yes, you must
>save all of the registers yourself and restore them after the "rti"
>(return from interrupt) command. I don't consider this an architecture
>failure.

One more time, and one more time only...

The Apple ROM kindly decodes break instructions from IRQ interrupts for you. In the process it has to wreck the Areg. Since it is going to store all registers in hardcoded locations anyway if it was a BRK it saves the Areg in location $45 before wrecking it. Therefore the minimum Apple interrupt handler is:

```
     IRQ  =    *
          LDA  $45
          RTI
```

If you want to save regs:

```
          LDA  $45
          PHA
          TYA
          PHA
          TXA
          PHA
     * Do what you will here.
          PLA
          TAX
          PLA
          TAY
          PLA
          RTI
```

Pushing the Areg on the stack is necessary if you want a reentrant interrupt handler.

I for one would be very interested in a technical discription/discussion
of the transfer protocols. Since I have designed and built the hardware
as well as written the driver for my serial port, I would like to take this
the final step. Any help would be appreciated.

Summary: Don't run on old Apples.

     I talked to a guy named Dave in the tech-support department.
He told me my Apple was too old to accomodate a Sider drive.
Aparently, the][series (I own a revision zero board from 1977 with
upgraded Applesoft ROMS) generates too much RFI. That interferes
with the drive and connecting cable... (Probably interferes
with DMA transfers.) Then I called the parent company Xebec
and talked to a few people there. Still no hope.. They said
try back in January, as they were re-working the interface cards
to be less sensitive to noise.

I'm giving up... Does anybody have a fat-Mac they want to get rid of?

I have some problems with a new 80 column card with softswitch.
When the screen is up, it moves the screen periodically.
I have no problem with the old 80 Col card.
Thank you.

If anybody has a list of active Apple clubs, especially on the east coast,
I would be very interested in receiving a copy. Also any active Apple
bulletin boards would be nice.

In case you happen to be in the market, I noticed DAK is carrying a Hayes
1200 smart modem clone for $169.00. It has all of the Hayes commands plus
quite a few neat ones of its own. I have no relationship to DAK or the
manufacturer (ADC) of the modem.

Well, in a recent issue of Incider, they review 5 other types of
high-capacity drive, including the Kodak Teammate ($895, 2.78 meg
of storage) to the Corvus drive (somewhere around $3000, 10 meg).

The Teammate uses removable media, so that is to its advantage.
However, all of the other drives cost vastly more than the Sider
hard drive, which is why there is so much discussion about it
right now.

I think it was in the August issue of Incider.

****Line eater????????**

I have just seen several ads for add-on boards for the Apple II
which add the 65816 chip. Looks good.
But..has anyone seen a note on a source for the 65802 which I think is

a "drop-in" for the 6502. I would like to try the "cheap" way first.
Can this chip be used in place of the 6502 in my IIe?
Has anyone seen a mail-order source that advertises this chip?

That's pretty close... Actually the baseline Christiansen protocol only checks for transmission errors with a raw checksum. (Add all the characters in the 128 byte buffer up in a 16-bit register tossing out any carries.. the result is your checksum). CRC checking was added sho

This is a follow-up posting on a problem I'm having with the Apple
80-Column card.

An odd quirk is that when the card is active, in 40 or 80 col modes,
the INVERSE acts peculiarly.

```
Try this:     10 FOR I= 0 TO 30
          20 NORMAL
          30 PRINT "NORMAL"
          40 INVERSE
          50 PRINT X
          60 NORMAL
          70 NEXT
```

If the screen is HOMEed first, the NORMAL prints in normal, followed
on the next line by a zero, in inverse mode. The rest of each line is
normal blank (black).
When the printing hits the bottom line, and scrolling begins, the
output changes: the word NORMAL is followed on the rest of it's line
by INVERSE BLANKS (white). The Inverse zero in the next line is
followed by normal blanks (black).

If you add commas to the end of the 2 PRINT statements, the inverse
zero is followed by inverse spaces, but hte normal "NORMAL" is follwed
by normal spaces, WHETHER HOMEed FIRST OR NOT!

I tried using CHR$ commands as in the 80-col manual, instead of the
INVERSE and NORMAL, but it was the same.

None of this happens if the card is turned off. I was able to get
around the problem when I found that using HTAB and VTAB prevented
this from happening, since no scrolling was involved.

If anyone understands why this unwanted INVERSE is happening, inspite
of issuing the NORMAL command, please post an answer, or mail me an
answeer. (My dealer is very reluctant to email this to Apple!)

Posted in response to several requests.

I wrote this a couple of years ago from documentation, and edited it just now. Note that a dollar sign indicates a hexadecimal number; for example $35 means 35 hex or 41 decimal. Ward Christensen protocol is a special case of XMODEM protocol and is what is used by Ascii Express.

Ward Christensen Protocol Description
=====================================

For initial handshake, the receiver sends a $15, then sender sends $01, the first block number (00), 1s complement of first block number (FF), then the special filetype block. It waits for $06 or $15, which mean ok or transmit again respectively. The other blocks consist of $01, block number, 1s complement of block number, 128 bytes of data, then a single byte checksum, which is the sum mod 256 of all the data bytes. As the receiver receives, it computes its own checksum; upon completion of the block it compares. If they match, it transmits a $06 for acknowledge. Otherwise $15 for negative acknowledgement. Then the sender sends the next block. A timeout of 10 seconds counts as a negative acknowledgement. This occurs during disk saves. Therefore the receiving computer must check the block #'s and scan for repeats. It also verifies the form of the block header by adding the first three bytes which should sum to 0 mod 256. At the end the sender sends a $04 and the receiver sends back a $06. In addition there is an AE pro checksum called Cyclic Redundancy Check, which is only printed. At 300 baud a block takes about 4.5 seconds.

If you are not using Ascii Express, simply XMODEM protocol, then the description of block zero may not apply; this is part of Ward Christensen protocol but not of the general XMODEM specifications.

Also of interest are the following diagnostic messages produced by Ascii Express while transmitting or receiving files.

```
     S <n>               sending block n
     R <n>               receiving block n
     T <ERR#n-i>         Timeout error, block n, error #i
     NAK <ERR#n-i>       Block sent not acknowledged as ok
     CS <ERR#n-i>        Checksum error
     BS <ERR#n-i>        Bad start - improper data format
     WB <ERR#n-i>        Wrong block number received
     FT <ERR#n-i>        Invalid file type
     SYNC ERROR!         unrecoverable
```

Note that all errors other than SYNC ERROR are recovered from correctly by Ascii Express. Verifying the CRC at both ends gives a 99.9% guarantee of accurate transmission.

If any of the above is unclear then please send a request. If it is of general interest I will post to the net as well as responding personally.

Summary:

I posted the preceding article before reading all of the recent controversy. However, I still believe that it is correct, and it does describe accurately how ascii express works.

(And by the way, I mind someone saying that I don't know what I'm talking about, in case you didn't guess before posting. I do know what I'm talking about. I was not referring to the history of the protocols, I was referring to their current state. Ward Christensen, in the current usage as far as I

have seen, is a special case of xmodem protocol where block 0 is a header block which indicates the filetype.)

Summary: 1200 Baud by ADC from DAK is $169

In article <272@ucdavis.UUCP> ccs007@ucdavis.UUCP (0058) writes:
>
>Also..DAL corporation (or something like that...warning...this is
>from memory) is offering a hayes-compatible 1200 baud modem
>for $159...can anyone verify or comment on this?
>
>Thanks,
>Gary Huckabay.
>!ucbvax!ucdavis!deneb!ccs007

I just happened to get one of their catalogs recently... DAK Inc., which sells electronic gadgets, has a Hayes Compatible 1200 baud modem for $169 + $6 P&H. From their description:

> ...ADC is a division of BSR, the enormous half-billion dollar electronics giant... [i.e. no fly-by-night operation]
>
> ...I just unplugged [my Hayes 1200] and plugged ADC's... the only differences I noted were improved monitor sound, more screen displays, and a help menu...
>
> ...ADC's modem recognizes a busy signal, hangs up, and keeps retrying the number every 30 seconds... [very useful... I think Hayes does not do this] ...waits for dial tones and network tones during auto-dial...

Of course I have not tried it. I cannot vouch for this modem, but it's a great price, and DAK _seems_ to be a reputable company. The autoredial is very nice (I use a prometheus- cost twice as much, !"#$# :-)). If anyone buys one, it would probably be nice to review it on the net.

     They also offer cable sets and communications programs, and serial cards for apple II series. ($30 for cable & program, $99 for serial card.)

DAK is at 1-800-325-0800. 8200 Remmet Ave., College Park, CA 91304.
I believe they have a 30-day satisfaction-guarantee.

Hope this helps those of you whoh have been limping along at 300 baud for lack of funds...

....Ranjit Bhatnagar

p.s. I have nothing to do with DAK or ADC, nor have I used any of their products. This message for informational purposes only. All rights reserved. Tresspassers will be prosecuted. Long live the revolution.

Except the screen moving problem, I meet another problem with
strange characters after booting for few minutes. Strange characters
appear randomly, like !, ', $...etc.
I don't know what happens, I exchange the Eprom with my friend's card,
nothing happens.
Would some experts tell me what happens?
Also, does anyone use a card called 'IC TESTER'?
Is it great to find out the fault of IC?
Thanks.

hi,
i just install my signalman mark xii modem with super serial card
using softerm ii program.
everything is fine, no first character missing with 80 column card
,but i can't read the response from my modem. eg, i type attd xxxxxx
to ask the smart modem to autodial, i'm suppose to see 'attd xxxxxx'
on screen and 'connect' when the carrier is detected.
it works fine when i'm using my apple communication card with 300
baud.
would anybody in networld tell me what happens?
thank you.

Also, I'm glad if some of the people here, can offer me a copy of Kermit for Apple //+ with a super serial card.
I know there is a copy in Compuserve, but I can't download using B protocol when using Datapac to access. It's probably caused by Datapac network.
So, I'm wondering if anyone can share this copy of public domain transfer program with me.
Also, I'm a member of Canada LOGIC club for Apple, however; it seems that they don't have Kermit in the P.D. disks library.
Thanks.

There are two word processors that might meet your current needs. The first is MEGAWRITER by MegaCorp. It works not only in Pascal but all of its commands are exactly those of Apple Pascal.

The other is a little harder to get your hands on. It is type in yourself that was published in an series of issues from Nibble! magazine, about two years ago. I have most of the program but am missing one entry. Check around on the net.

I don't know why your program is not working but if it is because the
characters are coming in too fast, then it is not too hard to fix.

    First of all, if you can make your communication card generate
interrupts (see AE manual) then you can operate at almost any baud
rate. I used a Super Serial Card with AE at 9600 baud and only lost
one character in about a thousand.

    If your card can't generate interrupts, change the termcap entry on
UNIX to increase the clear-screen delay time to an appropriate value
(you can experiment with this). If you don't have your own termcap,
you'll have to copy the relevant section of the system termcap file
(possible in /etc) into your own directory and

    'setenv TERMCAP yourtermcapfilename'

See 'man 5 termcap' for a description of the termcap file.

I am involved in teaching an introductory course using Macintosh
Pascal. We would like to have the students hand in a print of
a sample run of their assignments. As far as I can tell there
is no way to tell the Mac to print all that goes on in the text
window. Any suggestions would be appreciated.

Also, the print active window and print screen commands don't
seem to work with the laserwriter on the applenet. Is this a
bug or just a feature?

I am using an Apple Serial Interface card (not superserial) in Slot #1 with a Diablo 630 printer. When using WordStar under CP/M, if I try to print out a file, the system freezes up and I have to type any one key to get it to start printing. The letter "p" appears on the printer. Same thing happens after the file is printed -- freezes, hit a key to bring it back to life, and another "p" is printed on the Diablo. My temporary solution is to add a blank page to the beginning and the end of my documents, thus wasting two pages but improving the quality of the final printout (i.e., no P's).

Anyone have an explanation for this? Better yet, a solution? Please mail me directly.

> . And from an assembly language program you should output the sequence
> PR#3^M to $FDED.
>
> Alan J Rosenthal

No, no. From the assembly language level, you should:

```
    jsr $C300 ; Turn on 80 col card in slot 3
    jsr $3EA  ; Reconnect DOS 3.3
```

Using DOS commands from assembly language programs by printing those

commands thru $FDED is very tricky. You must trick the DOS
interpreter into thinking that your assembly language program is
a running BASIC program. See "Beneath DOS", Lisa 1.5 source, The
Randy Hyde Book, etc.

Some friends of mine have asked for my assistance in porting several
Applesoft 1.0 (UCSD) Pascal programs from the IIe to the IIc.

I understand that the firmware differs between the two machines; in
fact, the IIe Pascal disc won't even boot up in the IIc!

Does anyone know of a UCSD-like Pascal which a) runs on the IIc, and
b) can read data disks/files created by Applesoft? The local Apple
dealer, as usual, has no interest in assisting me and doesn't really
seem to even understand what I'm talking about...

In article <9800008@uiucuxa> ldr292@uiucuxa.Uiuc.ARPA writes:
>   This file is a binary file and can only be BRUN after another file
>RUNTIME has been BLOADed into memory. This is a real pain!!!

Actually, all you have to do is prepend your program with a
PRINT CHR$(4);"BLOAD <whatever>" before compiling. It IS annoying,
though, because:
     1) you have to compile a (slightly) different version of your
          program than the one you tested
     2) you have to copy the <whatever> file to any disk you want to
          run your compiled program off of.
Actually, I think I am going to take a crack at designing a Nice operating
system for apple over the next few weeks/months. You know, every time you
want to run a new program just about, you reboot the system, which is silly,
and every program has its own data format, which is silly (& incompatible),
etc.

Subject: Steven Jobs, Wall Street Journal;

Wall Street Journal 9/17/85

Cupertino, CA-- Apple Computer Inc. chairman and co-founder Steven P. Jobs is preparing to start another computer company and has hired away five Apple employees.

The move could prompt Apple to seek the resignation of Mr. Jobs, who was forced out of day-to-day responsibilities at Apple in a major reorginization four months ago.

Mr. Jobs jolted Apple Officials late last week when he anounced plans to create a company to make computers for universities, one of Apples fastest-growing markets. Though there has been widespread speculation that Mr. Jobs might embark on a new venture, his disclosure that he hired five Apple employees --including some of the computer makers brightest young engineers and marketers-- created some turmoil and resentment among top management.

"The executive staff has been stunned and shocked that this has happened" said William V. Campbell, an Apple executive vice president.

"I'm quite surprised that all this was being done while he was chairman, and, furthermore, it would concern me if he gets into business that's competitive with Apple," said Delbert W. Yocam, the Apple executive vice president who, with Mr. Campbell, oversees the companys two corporate divisions.

Apple said it probably will convene a special board meeting to discuss Mr. Jobs's plans. None of the board's seven members, including Mr. Jobs and Apple President John Sculley, was available for comment, and it isn't clear whether the board will ask Mr. Jobs to resign. But Apple executives are said to be discussing whether the board should determine if Mr. Jobs violated his fiduciary responsibilities by hiring away company employees.

According to a senior Apple executive, Mr. Jobs told the board at its meeting Thursday that he intended to start the new company. Mr. Jobs assured the board that the new concern wouldn't compete with Apple, and the board reacted favorably to the plan, the executive said.

According to the executive, who spoke on the condition that he wouldn't be identified, board members even said Apple would invest in the start-up and resolved to determine possible links between Apple and the new company later this week.

Hiring Away Five Employees

But the next morning, before a 7:30 staff meeting, Mr. Jobs presented Mr. Sculley with a letter that said he had recruited five Apple employees to join the new concern, the official said. That information, according to Apple insiders, sparked the firestorm that now surrounds Mr. Jobs plans.

"The board was upset to find out that this wasn't an idea-it was an accomplished fact," an official said.

As reported, Mr. Jobs this summer said he would sell about a fifth of his stake in Apple for roughly $20 million. With about 5.5 million shares of Apple left in his portfolio, he remains the company's largest inside shareholder, with about 9% of the 61.8 million shares outstanding.

In national over-the-counter trading yesterday, Apple closed at $15.25 a share, down 50 cents.

Mr. Jobs apparently plans for the new company to build a computer workstation for universities that would be more powerful than current personal computers. Beyond that broad goal, however, the direction the start-up will take is still hazy.

Plans for New Company

"We don't have a name, we don't have a bank account," said Rich Page, a senior Apple engineer who is leaving to work with Mr. Jobs. Mr. page said the new company's specific plans have been on hold until the five Apple employees involved in the venture resign. He said the five met with Mr. Jobs at his home Thursday night and offered their resignations from Apple the following morning.
The market for a powerful computer for universities could be a fertile one. Many university officials seeking to install computer networks complain that there is a big gap between today's personal computers and the next most powerful machines available: high-level scientific computers.

Apple has been seeking to narrow that gap by developing more powerful versions of its Macintosh personal computer. Even if Mr. Jobs's start-up doesn't compete directly with the Macintosh, the new company and Apple could wind up fighting for the same university dollars earmarked for high-level computer products.
Douglas Van Houweling, vice provost for information technology at

the University of Michigan, said he estimates that the market for high-powered university computers is between one million and two million units a year. He said such computers, if they were priced around $6,000, could be used widely for writing, research and communication in fields ranging from science to music.

The quintet joining Mr. Jobs includes some of Apple's most talented engineers and managers. Mr. Page is an Apple Fellow, a prestigious title that lets him engage in a wide range of advanced research projects. He said he has built four computers at Apple in the past several years, including some high-powered models in the category Mr. Jobs's new firm appears to be targeting.

Another influential employee in the group is Dan'l Lewin, currently Apple's manager of education marketing and one of Apple's cheif contacts with universities. The other three are Bud Tribble, Apple's manager of software engineering; George Crow, a manager of hardware engineering; and Susan Barnes, controller for U.S. sales and marketing.

Mr. Tribble was one of the original architects of the computer-program that controls Apple's Macintosh, and Mr. Crow helped design some of the Macintosh's key electrical features, such as its power supply.

The furor over Mr. Jobs's plans comes just as Apple is settling from the turbulence of its reorganization in May. As reported, two weeks after that realignment Apple fired 1,200 employees, or 21% of its work force.

"We've had a good quarter-the organization has come together after the reorganization,: Mr. Campbell said. "This incident seems to highlight turmoil at Apple, and nothing could be further from the truth."

Well tonight I finally saw it, the 20 meg Apple hard disk, as well as the new imagewriter. First let me say the disk and the imagewriter were displayed for us; we were not allowed to play with them, nor make timing tests. The hard disk is about the size of three MacBottoms stacked one on top of the other. It plugs into the external drive port of the Macintosh and has another port for another drive, either another Apple hard disk or an external floppy drive. At most only two hard drives followed by a floppy can be connected. Also currently the hard drive cannot be booted without a floppy in the internal drive. In terms of performance it is certainly the most quiet of any of the disk drives I have heard. In terms of speed it is slower that the Hyperdrive, and slower than the MacBottom, but faster than any of the other hard drives. We were only shown how fast it takes for the drive to startup the switcher and some applications; we were not shown how long it takes to restart up the Finder after quitting a program a procedure which often slows down the other hard discs.

Also new is the filing system in which folders are used to a greater extent as directories and subdirectories. The new drive is not partitionable into separate volumes, but the role of folders is expanded into a form more like directories. File names now need only be unique within a folder and not unique within a volume. Folders are no longer simply creations of the Finder which only exist within the Desktop. If you are in an application and activate open in the menu you are presented with a list of files to choose from which are in the active folder. Another window lists all the folders within the active folder if your file is not in the current folder, and there is an icon to click the to access the folder or disk which holds the active folder. The Apple representative stated that neither the number of files, nor the number of folders, nor degree of nesting changes the speed in accessing the drive; thus Apple claims that large number of files does not slow the system down which is a problem many of the other drives have.

The new system is called the Turbo File System which is a RAM based operating system and is accompanied with Finder version 4.26. The demonstration of the new filing system was very impressive. I asked a question about backing up the hard disc, and was only told that the second port on the drive was configured so that a 3rd party company can market a tape drive for backup. Also future plans include a server program to allow the drive to be shared on Appletalk. Other incidental trivia which was mentioned: The drive does not have an automatic print spooler. It has a

separate on/off switch. It automatically parks the disk heads when powered off, and can withstand 20 g's while operating and 60 g's when off. Also there is no problem stacking two of them underneath the Mac.

The Imagewriter II was also demonstrated. First the bad news: its case is the same ghastly bright white as the Apple IIc, so it does not match the Macintosh's beige (that was my mom's only comment during the whole evening). It also has a new eight pin circular socket which is unlike either the RS232 or RS422 port, meaning you also need to obtain an interface cord which is only available from Apple. The good news is that it is much faster than the old imagewriter. I don't remember the stats, but apparently the new printer is faster in standard print mode than the old printer is in draft mode. Also the printer has far greater resolution than the old printer. Furthermore the printer has room for cards. One card is planned for the printer so that the printer can be addressed via Appletalk and thus be shared by several Macs. Another card provides a 32K buffer which would probably be more useful for Apple II users. Also more applicable to Apple II users is a speed control which affects the speed of the printer while in ascii mode; the control has no effect while printing in the Mac's graphic mode. The new optional sheet feeder is the best sheet feeder I have ever seen. It did not jam once during the evening and is easily removable to convert to traction feed and back also feeding sheets individually without the feeder is a lot easier than feeding sheets into the old printer. The printer supports a new 4 color ribbon; although software to use colors is only available now for the Apple II; the old monochromatic imagewriter ribbons also can be used. The new printer is also a bit larger than the old one. Current plans are to discontinue the old Imagewriter and market the new one at the same price as the old one. The Imagewriter 15 will not be discontinued, and the new printer driver supports all three printers. I forgot the announced prices, but these were posted in a preceding article in this newsgroup.

Also demonstrated was the new modem which is the size of a pack of cigarettes. Not much else to say about it; it is designed to be out of the way by staying on the wall where it is plugged instead of taking up desk space. It also has the new eight prong socket and is the same color as the new printer.

One more item Switcher 5.0 will be marketed at $19.95. The understanding the spokesman had was that Switcher is not public domain; people can either but it for $19.95 and get the manual, or join CompuServe and obtain copy. Non CompuServe subscribers are not entitled to a copy. Version 5.0 will also be placed on CompuServe.

The standard disclaimers apply: some of the names mentioned are

registered trademarks, I do not work for Apple Computers and neither does my mother.

This is in response to a question about shift-key modification for the Apple][+. I have used two different gadgets to do this, and they both involved connecting a clip to a pin under the keyboard at one end, and to the game I/O port on the other. The first unit, from Micromax, had a 16 pin chip-like device that plugged into the game I/O port. It was designed so that another connector could then be plugged on top of it. Therefore you would have no conflict with joysticks, etc.

The second device, which is in my current Apple][+, has, instead of the 16-pin business, a second clip, which itself attaches to one of the pins on a game connector (I happen to have one of those game I/O extenders which allows you to hook up your joystick easily outside the case.) I prefer this one, since I did not have to unplug my game port extender (I hate removing and inserting chips!!!) to make it work. I purchased this device for a very reasonable price from a local Apple dealer. Sorry, I do not remember the name of the product.

It is also possible to do a hardware modification which requires some motherboard soldering, or suchlike. I myself avoid this kind of remedy like the proverbial. Since these other devices are for sale, you probably will want to do likewise.

I am currently considering upgrading to the wonderful world of 1200 baud from my 300 baud Micromodem II. As I see it, there are two possible ways to go about this: (1) Modem card (Prometheus Promodem 1200a), or (2) separate serial card plus external modem.

So, what's best? Beats me. Anyone have some ideas they would like to share on this subect? Which way is best? Which hardware have you had success with?

For the record, my system consists of an][+, PCPI Starcard Z80 card, Videx Videoterm (will it handle 1200 baud, cursor positioning, etc?), ramcard and Epson parallel interface.

Please mail your replies. If anyone is interested in the results, I will post a summary in a couple of weeks. Thanks!

Here's the problem:

I would like to have an RGB monitor that I could you with an Apple IIe and, hopefully in the not-too-distant future, an Amiga. Given that both computers begin with "A", this shouldn't be too hard. But seriously....

1) I've heard that Amiga developers like the Sony KV-1311CR monitor, but I've also heard that special cables are needed. So, I'm wondering:

   a) is it hard to find adapter cables (and is this all that you need to do to make the Sony work with the Amiga)?

   b) is there an RGB card available to interface the Sony with the Apple IIe?

2) Has anyone out there had any experience with the Apple 100 RGB monitor? Would it work with the Amiga?

3) Is there a different monitor I should be considering instead?

4) Will Commodore develop an Apple emulator so I can just trash the IIe or is IBM the only machine worth emulating?

5) What is the meaning of life?

I would appreciate answers to any of the above, but keep it brief on #5.

Many thanks in advance.

Any comments on the Steve Jobs fiasco? Personally, I'm rooting for
Jobs. If Apple has become a big dumb company, its good employees
should be ENCOURAGED to go off and form startup(s), where they can do
good things for society instead of battling petty departmental
politics. In recent Apple moves (firing Jobs, hassling him afterward)
bigness and dumbness are certainly evident.

(Followups to net.micro only, please.)

New Imagewriter printer by Apple. The manufacturer's warranty lasts until
December. I have cables to connect it to a Macintosh, but it can be used
with other computers through a serial card. $400/best offer.

Can anyone suggest a fairly decent letter quality printer for
use with an Apple II plus with a Parallel interface. I would
like to keep the cost within $500. I have some quotes on
Silver Reed EXP 400,500 & 550. Also Olympia. Any other facts
about these or others would be greatly appreciated. I am going
to use this with the Apple CP/M version of Wordstar.

Thanks.

I have a problem with the Apple 80-column card, which I've been using
for some time. This is the regular Apple extneded 80-cloumn card in
the auxiliary slot on an Apple //e, recently enhanced.

In order to display data under a page 1 hi-res graph more clearly, the
headers are in normal, and the data is in inverse. (This is in a BASIC
program.)

When the inverse is over, the next blank line prints as an inverse
line, even if I precede the line with an explicit NORMAL statement.
The next blank line prints normally. If the next line after the data
is an input statement, the blank rest of the line after the input is
inverse also.

There is no problem of this type doing it in 40-columns, with the
80-col card turned off. In addition, there seems to be no reference to
this problem in the 80-col manual.

Does anyone out there have any understanding of why this is happening?
Please send me mail.

I have available the T-NET 2.0 (version 2.0h) Electronic Bulletin Board
Softwarefor the Apple //. T-NET 2.0 is an extremely powerful and flexible system,
which
has been used on many great bulletin boards across the nation, including a
really great one which I had to take down because the owner of the hardware
had better things to do.

System requirements are an Apple //e, possibly a //c, or an Apple][+ with 64K
and a lowercase chip; a Novation Applecat modem, or a Hayes modem, and at
least two disk drives of online storage, or at least 280K of the equivalent.
A really *great* system requires more than two disk drives, or, better yet,
a hard disk drive, and a 1200 baud modem.

With 1200 baud, the software will autoseek between 0-300/1200 baud rates.
TNET 2.0 is written under ProDOS 1.1.1 (included), and thus uses subdirectories
of your own designation- great for hard disks. The software supports up to
30 message bases, and is easily expandable under Applesoft. Direct author
support and a manual are included.

The software also supports 'Go' modules, program downloads, and 'TP' textfile
downloads. Tedious routines are in machine code, control software in Applesoft.

In the category of terminal bigness, dumbness, and arrogance: Jobs'
enthusiasm for closed architecture, and his insistence that the only
developers Apple would give the time of day to were the big ones
(Microsoft, Lotus, etc.), takes a bigger cake than anything done by
the surviving Apple management.

According to John Sculley, the man who tossed Jobs, the next generation
of Apple machines will have an open architecture, and Apple will be
immediately working to improve its relations with, and support for,
third party developers. Sounds good to me.

I like my Novation Appla-Cat 212. It is on the expensive side, $400+, but
it has many good features such as tone dialing, a hand-set, rs232 interface,
and a power regulator. (In case you're into turning on your blender with
your computer.) I also use Ascii Express 4.2 with it.

[]

I'm writing a data acquisition package for a client, and I'd like to
use Pascal for the code. A potential problem is that the client

would like to download the data to a VAX 11/780 running VMS. Does
anyone know of a commercially available (or public domain) communication
package which would allow transfer of Pascal files to the VAX?

Please reply by e-mail to
     ...!ihnp4!wucs!wuibc!ed

And thanks in advance!

Ed Macke

For sale:

 (1) Apple //e
 (1) slightly re-arranged Disk][drive with interface
 (1) IDS 480 Microprism printer
 (1) Grappler+ graphic dump interface to go with above
 (1) Video-7 RGB/64 combination RGB interface and extended 64K 80 column
     card for above
 (1) Taxan RGBvision III monitor (digital, 640x262 res., .38mm dot pitch)
     which also says "Acorn Computer" on the front (for above with an Apple //)

Features and other stuff:

  The Apple //e CPU has been upgraded (by the dealer) in the following ways:
It's got a revision B motherboard, a revision B keyboard with an uncharacterist-
ly good feel for a //e, and the 65C02/ROMchip/char_gen upgrade

  The re-arranged in Disk][means it no longer has a write-protect sense,
but rather a homemade switch. I'll part with it cheap.

  The IDS 480 Microprism is a sort of fast (80 cps/110 cps) printer which was
the first to have a real correspondance mode, and looks better than some of
the other correspondance modes you'll see- I'll send you a copy via USmail
if you like. The Grappler+ is your standard control-I and dump Anything
printer.I've got the pinter working with Applewriter //e 2.1 and Appleworks.

  The Video-7 card is just like an ext. 80 column card, making this a 128K
computer. The Apple //e graphics (even double-high-resolution) cannot do justiceto
the Taxan monitor.

Also for sale:

Applemouse //e (with //e interface card)
Mockingboard C sound board (uses 6522 versatile interface chip, has 6 pure
                            tone channels divided three into left and right,
                            two noise generators, and the really amazing
                            SSi 263 (as seen in Byte) speech synthesizer
                            chip on board. With much software.)

And a lot of disks full of interesting creations.

And software.

< this line intentionally left blank >

A few months ago, I got something in the mail from a company
in Washington (I think). They were offering Wordstar for the
Apple for $165, and "throwing in" a 6MHz CP/M card complete with
64K RAM and a 70-column function on the same card.

It sounded too good to be true, adn I was getting an AMIGA anyway,
so I just filed it (not in the round file). Now, my mother wants
a word processor, so I'm loaning her my Apple][+. She needs all
of the above. So...

Is this company for real? I'm sorry I don't have the name at the
moment, but hopefully someone will recognize this offer. Anybody
order this?

Thanks.

Dynax used to make a inexpensive letter quality printer for under $500.00
I dont know if it is still being manafactured, but if you come across one
the last price I saw was about $350.00.

Good Luck

Although I never did it (having a 2e instead of a 2+) a friend
of mine discovered that the 2+ keyboard PCB uses a keyboard
encoder chip with provisions for lower case - it just isn't
hooked up. Furthermore, a standard slide switch can be installed
in HOLES ALREADY PROVIDED ON THE PCB that gives either standard
Apple or upper/lower case with the keyboard shift key. He chose
to mount the switch on the front panel anyway for convenience.

The problem is in the Apple monitor, which masks any lower case
to upper case. The fix is simple if you put the monitor in the
language card RAM.

I had the same problem on my Apple IIe. Seems that the wonderful
screen drivers written by Apple in the monitor (and Apple 80-column
card) ROMs are a tad slow, this being the fault of one Stephen

Wozniak who contorted the screen memory map all over the place to save a couple of chips, forcing the good ol' 6502 to go thru all sorts of calculations. Anyway, there are three solutions. 1) Re-write the video routines and figure out a way to interface them to AE. 2) Buy a third-party 80 column board. 3) Buy a terminal program that works at 1200 baud.

I started on 1, and gave up when I came across three. Now, I'm using Apple Access (from Apple) which deos work at 1200 baud and does a semi-decent VT100 emulation (but not perfect). I do like AE, though and I may still attempt to hack my re-written video drivers into it. If so, I will post to the net. If anyone wants a listing of my semi-finished, faster screen drivers, drop me a note.

Ditto. However unfortunate the circumstances were that led to Jobs'
dismissal, the fact remains that he attempted to target the business
market with the Mac without listening to what business users wanted.
Apple management appears willing now to opening the Mac's architecture,
a move which will certainly improve the Mac's market potential.

Does anybody know whether you can replace the 65(C)02 in an Apple IIe/+/c with the 65802 without causing serious compatibility problems? If you do, and if it works, what do you get for your efforts? No chance of direct addressability to memory beyond the II's hacked over 64K, of course, but do the 16 bit registers work?, howabout the 'direct' page stuff?, the block move instructions? Does it mess up any of the timing loops (like in the disk driver software, and the paddle reader software)? Or did they preserve the same number of clocks per instruction as the 6502 as a compatibility 'feature'?

Interesting,

RIck Thomas

HELP NEEDED!!

A writer friend of mine needs help with an Apple IIC with Pro-DOS. She
wasn't very conscientious about backing up disks, and has suffered
her first disk crash, costing her 60 pages of prose that HAS NEVER BEEN
PRINTED.

She is desperately searching for some utility that will read the crashed
disk sector by sector to salvage some of those 60 pages worth of work.
The corporate Apple hasn't been able to help. They do not have such a
utility for this machine/operating system.

Can anybody help?? My friend's great thanks, and my own, in advance.

Adrienne Regard (path above for e-mail).

My Apple //e keyboard has been giving me trouble --
one of the keys does not give any indication at all
of being pressed, and another is flakey.
After taking apart the case and disconnecting the
keyboard, it seems that I have the choice of either
replacing the bad keyswitches (unsoldering carefully
then soldering in new ones) or getting a replacement
keyboard. But my Apple dealer will not sell me a
replacement keyboard (their contract with Apple will
not allow it, they tell me -- but they would be happy
to repair it for a minimum of $90 plus parts and labor).
So on to the mail order housses -- none have a replacement
keyboard for the //e (][and][+ yes, //e no) that I have
found, but they will sell me an external keyboard for
about $200.

Help, please:

1 - Does anyone know where I can get a replacement keyboard to fit in my //e case?

2 - Does anyone know what kind of keyswitches are used in the //e keyboard, in case I have to replace them myself (ie. no good answers to question #1)?

3 - Does anyone know why Apple will not sell me a replacement keyboard, when all I would have to do is plug it in?

Thanks in advance.

Mark,
     There is a company which sells stuff, Jamiesco or something like that,
I've got their catalog at home. They sell everything. As to your other
questions, I'm having the same problem's buying a powersupply for an apple 2+.
I'll post the address sometime tomorrow.

Is there a public domain routine for dumping the screen to an
Imagewriter? My wife's students are working in LOGO and trying
various things, but the example in their text (Krell) is given
for the Silentype only.

Please reply by mail. Thanks.

Yes, they are for real. The company is Micropro International Corp. and they are in San Rafael, CA. Not Washington. Wordstar is a registered trademark of Micropro International Corp. The CP/M board is the so called 'Starcard', which is actually the PCPI Applicard. I can't validate the price, but it sounds like it is in the right ballpark. The 6MHz Z80 is as fast as the wind. I run Turbo Pascal on it and I am continually impressed with the speed. Wordstar is also quite sprightly. The 70-column function is implemented in software, and it is *not* useful as a replacement for an 80 column card. It is there so you can run wordstar even if you dont have a real 80 column board. You still need a hi-res monocrome monitor to read it, and the characters are displayed in a 4x8 dotmatrix. (Work it out: The Apple hi-res screen is 280x192. 280/70=4 and 192/24=8.) Not the sort of thing you would want to spend all day reading. However, if you get an Apple extended 80 column card to go with it (or a RAMworks from Applied Engineering) you can have a full, quite readable, 80 column screen, and there is a software package available (from Applied Engineering) that uses the extra bank of 64K on the extended 80-col card (or the extra up to a Meg on the ramworks.) as a RAMdisk. Now, talk about *FAST*!

I have one, and I recommend it.

Rick Thomas
ihnp4!attunix!rbt

PS while I am on the subject of RAMdisks, the starcard comes with a software driver that attaches to DOS3.3 and uses the 64K on the Z80 card as a ramdisk for the 6502. For an exorbitant price (a couple of hundred dollars) you can get a piggy-back card for the Z80 from PCPI that will expand the Z80 to a total of 192K, all of which can be used by the DOS3.3 ramdisk software. PCPI does not offer a PROdos version of this software, so I am working on writing one. If I ever get it finished, it will probably be available thru PCPI.

PPS. The package from Micropro includes the hardware and instructions for
installing the 'one-wire shift-key mod' on the II+ in case you haven't
already done so yourself.

Disclaimer -- I have no connection with any of the above companies.
My employer and the owners of this computer undoubtedly have their own
opinions, which may be different from mine.

Help!!!. There several people at this college that dialup with
an apple (//,+,//e,//c or ///),but our apple termcap here seems
to be obsolete. So is there any one who has a updated termcap
for an apple computer?? . If one wonders we have a vax 11/750,
here at Daemen College.
                                        Roman S Malutza

Ps.Urgent call ,Please send the termcap,as soon as someone lays
a hand(eye) on one,and mail it.

The 65816 is indeed pin-compatible with the 6502 and it may be
possible to "drop" one into an Apple II without major problems,
provided you don't want to address more than 64K. In order to
address the 16 megabytes, Western Design uses the data bus as
address bus for the half CPU cycle that the data bus is not used.
Unfortunately, during the time, the video is busy playing with
things. I believe that the MMU switches the CPU off the data bus
during that time.

Some friends of mine who own an Apple][want to get a daisy-wheel printer and a Word Processing program from their machine, and they asked my advice. Having no experience in this area, any suggestions from you folks would be greatly appreciated.

After discussing it with them, I believe they would like a WP program which is fairly easy to use, but has capabilities for footnotes, etc. -- they have two kids going into high school who want to use it for papers. Also, the printer and WP program should be compatible :-).

Either mailing or postings are fine (the latter if you feel this might be of general interest). Thank you very much in advance...

Doug, kindly go soak your cpu in a lake. I'm a reader who is intrested
in for sale postings, as I'm trying to put together an AppleII blackbox
system (Bell & Howell). I read this newsgroup for all information
related to Apple's. I vote the for sale's stay. For many people
this is a BBS.

[Put your Apple where your mouth is]

Almost every time I look in net.micro.apple, I find people asking questions about how to get an Apple to talk to a Unix-system. I once had the same problem, so I started collecting termcaps for the Apple, only to find that most of them didn't work as expected. The problem seems to reside in the terminal driver in the Kernel. Different computers have different Kernels, so the best thing to do is to talk to your local terminal/Kernel guru and let him/her have a look at the following termcaps.

The one I have found working best, both on a PDP 11/45 and on a VAX, is the 'ap' entry. I use this entry together with Ascii Express Pro 4.20, with incoming and outgoing

terminals both on 0, emulation On.

I hope this will be of any help to those of you who are still searching.

----------< CUT HERE >----------

```
# The modem interface is permitted to discard LF (maybe DC1), otherwise
# passing characters to the 80-column firmware via COUT (PR#3 assumed).
# Auto-wrap does not work right due to newline scrolling delay, which also
# requires that you set "stty cr2".
# Note: Cursor addressing is only available via the Pascal V1.1 entry,
# not via the BASIC PR#3 hook.  All this nonsense can be avoided only by
# using a terminal emulation program instead of the built-in firmware.

Gees, are you guys strict! Actually, the cross-posting happened
by accident. I used f (follow-up) to add this message, not
realizing that the message I randomly picked to follow-up to
had been posted to net.games as well as net.apple.

My apologies to everyone who has lost sleep, money, pease-of-mind,
or karma, due to my horrendous blunder. I am not worthy to lick
the underside of a toad.

Summary: A quick summary to the $165 Wordstar card

The response I got from about 20 different people amounted to this:

The company (BroadReach) and the product are for real and excellent.
The only problem is the 70-column feature which is apparently close
to illegible, since everyone suggested getting an 80-column card to
go with it.

Thanks to everyone who responded. I'm going to go for it.

Forget it; without a working "cr" capability, most screen-oriented
programs are useless on the Apple II. If you are using software
that emulates something else, you avoid this problem; in which case,
set TERM= whatever terminal is being emulated (often vt52 or vt100).

Keywords: videx, ultraterm, videoterm, 80 column

I am purchasing a Videx Ultraterm for use with my Apple II Plus revision 4.
I have three main intentions in mind: Calling up a UNIX system,word
processing, and 6502 programming, all in 80 column. I need suggestions for
a word processor and a terminal program compatible with the Novation Apple
Cat II modem. Right now I use COM-WARE II for a terminal program, but that's

not too sophisticated (It would be nice to emulate a terminal like a VT100).

An added bonus would be the ability to use the full 160 or so columns
and the 48 lines of the Ultraterm. (I am aware that you can't have 160 across
and 48 down simultaneously.)

Also, if you have any comments/suggestions about the Ultraterm in general,
send mail.

Personally, I wish Mr. Jobs all the luck in the world. Apple was started to
get computers to the people, and now they're just a business, like everyone
else. Too bad.

New Imagewriter printer by Apple. The manufacturer's warranty lasts until
December. I have cables to connect it to a Macintosh, but it can be used
with other computers through a serial card. $400/best offer.

Help!!!. There several people at this college that dialup with
an apple (//,+,//e,//c or ///),but our apple termcap here seems
to be obsolete. So is there any one who has a updated termcap
for an apple computer?? . If one wonders we have a vax 11/750,
here at Daemen College.
                                        Roman S Malutza

Ps.Urgent call ,Please send the termcap,as soon as someone lays
a hand(eye) on one,and mail it.

Does anyone have experience with an AE RAMWORKS w/ RGB option ?
If so, how is the color quality with respect to text on a hi-res
picture ?

Is the new Color Enhancer by Video-7 better ? They have an
interesting ad in Oct. 85 A+ Magazine.

If you have used either I'd be interested in your comments by mail.
Thank you.

I noted that in the October Dr.Dobbs the editorial says

    "Rockwell fit a good chunk of Forth into its R65F11 chip, along with
     the 6502 instruction set."

Now, can anyone tell me

  - What is a "good chunk of Forth"? (I am interested in whether this
    "good chunk" might be a better target for a compiler than regular
    old 6502 instructions.)
  - Is the "6502 instruction set" on this chip compatible enough with
    the "regular" flavor to run Apple software (such as DOS, the
    monitor, Applesoft, etc)?
  - Is the chip hardware (just-plug-in) compatible with an Apple II (not
    II+, IIe, IIc, or any other II-mumble... just an old, decrepit,
    obsolete, antique, (mostly) unmodified Apple II.
  - Is the R65F11 the "same thing" as the 6511EAB mentioned in message
    <42@noscvax.UUCP>? If so, the above questions apply to the
    "6511EAB" as an alternative to the R65F11. If not, are the two

things related at all?

If nobody knows, does anyone know a likely source to write for this information? Any help will be greatly appreciated.

Wordstar is the best word processor for the Apple, but, you will have to get a Z80 card. Why is it better?

1) It is not protected: This means that it is possible to install for any type of printer, display etc.

2) There are many third party programs and tutorials for wordstar (like footnote, pair etc.).

3) Wordstar can be run on thousands of machines. With such a large market, Micropro could afford to put much more money into development than a maker of a "just apple" word processor.

4) Wordstar is not as hard as people claim. Sure, it is VERY powerful, and some of these powerful features are hard, but it is easy to learn enough for a school paper. (then again, I always thought unix was easy.

5) In this case, with high school students, wordstar would be the best to learn. Wordstar is a common program on college micros, so they will not have to learn another word processor.

I hace no recomendations for daisy wheel printers, but, beware. Unless
you want to spend a lot of money, you will get a very slow printer.
Also, wordstar is easy, but the installation is not if you have bizzare
equipment. I suggest a printer that emulates one that wordstar supports
(like the diablo 1610). However, it is possible to install any printer.
I have a Morrow (actaully a smith corona I think) that emulates a 1610.
I also have an Epson, because the daisy wheel is so slow.

-Chris

I am currently writing a program for a friend in the ROM Basic on the Apple IIE and I am in need of a little help on a few things. I am a little familiar with the Apple IIE and only slightly more familiar with the Rom Basic that is included with the machine. First, I would like to be able to trap any control characters inside the program which would halt execution (such as CNTL C) of the program so that the program can be exited gracefully. Is this possible and if so can someone enlighten me as to how? Second, has anyone heard of or posses some kind of "down-loading" program which will take a Basic program and convert it to machine code? I would appreciate any help that I receive on these two matters. Currently I haven't a clue on either one. Please respond by mail to me. Thank You.

[replace this line with a beautiful thought]

I am looking for an Apple Kermit which will support
the Apple //e extended 80 column board. The kermit I
have now works only in 40 columns, and this makes my
eyes look like tomatoes after an hour or so.

If you have what I'm looking for, please mail to me.
If, and when I get the Kermit, I will repost it to
the net.

Thanks in advance,

Kees Huyser

Has anyone delved into using the Smarterm 80 column board for the Apple][+?
I especially need information on how to access the screen memory, and
information on the card's routine entry vectors.

                        Thanks,

I think the idea is that "for sale" postings should not be posted to overseas,
is it not? (This inference is from the fact that there is a na.forsale group.)
So if you are going to offer software for sale, just restrict the distribution
to na. Or even less, if appropriate.

[Bob's Beer]

Mark H. Mortensen [houu2a!9212mhm] sez:

> My Apple //e keyboard has been giving me trouble --
> [...]
> it seems that I have the choice of either
> replacing the bad keyswitches or getting a replacement
> keyboard. But my Apple dealer will not sell me a
> replacement keyboard (their contract with Apple will
> not allow it, they tell me -- but they would be happy
> to repair it for a minimum of $90 plus parts and labor).

I would say the your Apple dealer is FULL of it! You should be able to purchase ANY parts, boards, etc via your local Apple dealer.

Sounds to me as if your dealer is just RIPPING PEOPLE OFF! [I should add that if this _IS_ Apple policy, then I'm sorry -- >ALL< the dealers I have EVER dealt with will sell parts, swap boards etc to their costumers.]

>   2 - Does anyone know what kind of keyswitches are
>   used in the //e keyboard [...]

     In limited experience with fixing keyboard switches I found there were basicly 3 kinds of Apple Keyboards: The OLD][keyboards {the version with the copper pads that touch when you press a key}, the //e keyboard {it has 'micro-switches' that are individually replaceable}, and one that uses slightly different micro-keyswitches.

     These micro-keyswitches are CHEAP. [read ~$0.45] To install them takes no time at all and it's real easy. I once broke a key-cap stem on my OLD][+ keyboard. {The one with the copper pads} I tore it out and took it into the local dealer. Problem was that Apple has not been making parts for the 'pad' keyboard for quite sometime. Thus I had to "swap" the keyboard for a new one. The cost was ~$50.00. At the time I swapped by keyboard, I bought 10 or so keyswitches for the new keyboard -- just in case Apple decided not to support my new keyboard I had just swapped to get!

To everyone who sent help to my poor friend who crashed her Apple disk, which contained never-printed text that she badly needed:

Much thanks. I've forwarded the information to her, and she is taking action as befits her abilities. She and I were gratified at the level

of response and helpfulness from the net. I attempted to answer each letter with personal thanks, but got a couple "uucp" copy fail messages, so I know they didn't all get through. Please know that we tried to reach you all to say thanks.

In article <776@decwrl.UUCP> binder@dosadi.DEC (No matter where you go, there you are.) writes:
>There still aren't a whole lot of WPs around for the Apple][and // machines
>that are better than Applewriter. For a][+, Applewriter][, and for a //e or
>//c, Applewriter 2.0 would be my recommendations.

Although Applewriter is a pretty powerful word processor, I find it much harder to use than AppleWorks. The word processor within AppleWorks has most of the features found in Applewriter, but is more friendly and easier to understand. The interface is very intuitive - you just sort of type and things happen.

The printer interface is by far the best I have seen in any product for the Apple. It knows about all sorts of printers and cards, but if you have one which isn't there, you can define a custom printer and give it all the special codes it needs. Also, AppleWorks has a database and a spreadsheet built in. For my personal use, I find the spreadsheet to be useful - It would probably even be powerful enough for a small business.

All in all, AppleWorks is an excellent package. It only functions on the //e, //e+, and //c - but that's what most Apple owners have anyway.

My brother still needs a set of Applesoft Roms so he can run ProDOS
on his Apple II. We were going to get the Apple motherboard from JameCo,
but they don't sell it anymore. Is there any other source of ROMs besides
the costly Apple versions?

Hello again all.
I used to see an ad in A+ magazine for the PDQ Periphal 2. As I understood the ads, it basically reworked you Apple II+ into a workable v7 UNIX if all the options were picked up.
AS I remember, all the options included:

1. 1 Meg of workable memory.
2. 68000 microprocessor.
3. USCD F77, Pascal, Basic, and C compilers.
4. Unix v7 mutliuser system. (If put on Hard disk.)

Well, now I have some spare money, I want to experiment with this thing. However, the ads have disappered and I have no Idea what, who, or where this company is. And I would really like to find out.
If anyone can steer me in the right direction, please let me know via E-mail.
If I get enough responses, I will post a summary to the net.

Thanks for the help.

P.S. This should be for an Apple II+.

No, the idea is that it is forbidden to use the Internet, which is
not a "common carrier", for direct commercial gain. The taxpayers
are footing the bill for it. Abuse can cause the loss of access
to the Internet.

Also, there are commercial "for sale" channels, many of which
specialize in listing hobbyist computer systems, often for free.
Why make hundreds of UUCP sites pay telephone bills to help you
make a buck, when there are more appropriate ways to sell things?

I am using the TASC Applesoft compiler from Microsoft for a data analysis program that receives its input from an interrupt driven routine (written in assembly) that deposits the data in COMMON.

The following problem occurs: As soon as the compiled program executes a terminal I/O or high-resolution graphic statement (such as a PEEK to check for pending terminal input, or HPLOT), the program behaves unpredictably - usually it terminates with a garbled error message. The same program works just fine if executed by the Applesoft interpreter, or if the compiled program turns off the interrupt system during the execution of the 'sensitive' statements (unfortunately this is not an acceptable solution).

It appears that some of the runtime library routines of TASC interfere with interrupt processing, though I have no idea how. Base page conflicts can be ruled out -- the only base page location used during interrupts is location $45, which is not used by TASC (according to Microsoft documentation).

Questions:

1. Did anyone have to deal with a similar problem and found a way around it?

2. Does anyone know the cause?

3. If it is indeed the fault of the compiler, is there another Applesoft compiler that does not have that problem?

  Hi everyone...Listen, I just got through looking at the
latest issue of Incider, and First Class Peripherals has
dropped the price of the 10 megabyte hard drive "Sider"
to $595!!! This makes it only $96 more expensive than the
new Unidisk 3.5! Here's your choice: an 800k drive for $499,
or a 10 meg drive for $595....

Not quite true. Videx sells a preboot disk that allows Appleworks
to be used on an Apple II or Apple II Plus with a Videx 80 column

card.

The following is the text of a letter I sent today to Applied Engineering about their Ramworks ramdisk driver for the PCPI Applicard CPM card for the Apple II series.

My question for the net is --

Does anybody have a fix for these problems?

Also, if Steven N. Hirsch is on the net (He appears to have been the author of the driver in question...) would he please get in touch with me.

Please respond by E-mail, if possible.

Thanks in advance

Rick Thomas

Applied Engineering
PO Box 798
Carrollton Texas 75006

Dear Sirs:

I recently bought a copy of your ramdrive device driver for the Applied Engineering Ramworks(tm) board and the PCPI Applicard(tm).

I have noticed a couple of problems with it that I hope you will correct in later releases. I would also appreciate it if you could send me an appropriate patch for the release I have.

I am using it on an 'enhanced' Apple IIe, with an Applicard in slot 4, an Apple Super-Serial card in slot 1 for my serial printer, an Apple Duo-Disk in slot 6, and an Apple extended 80 column color card in the Auxiliary slot. I was told over the phone by your tech support people before I bought it, that the software would work with the Apple color card just as well as with the Ramworks card, though the resulting ramdrive would be small. In fact it does seem to work quite well. There is enough room in the ramdrive for a copy of Turbo Pascal, PIP, and a few other useful utilities, and even a small amount of scratch space left over. I have a small "SUBMIT" file on my boot disk that loads up the ramdrive with the things I want on it at system startup time. The feature of configuring the ramdrive as disk A: is really very nice!

The first problem is really quite trivial, and I would not mention it at all, except that I am already writing to you about the second problem. The first problem is that the "R" and "W" that are supposed to flash in the lower right corner of the screen, appear as mousetext instead of letters on my enhanced IIe. As I say, not a big problem, but something worth noting for future releases. Personally, I would have preferred to hear the speaker grumble a little bit when the ramdrive was working, instead of having one character of my screen be taken away from me, but that is a matter of preference. (After all, real disk drives make noise when they are doing something, why not the ramdrive too?)

The second problem is somewhat more serious. The README.WS file that comes on the same disk with the software warns of a potential conflict between the PCPI BUFFER.DVR printer driver and the ramdrive software over control of the first (in my case the only) bank of auxiliary memory. It says to "Be aware of this, and install accordingly." But it does not say what installing accordingly means. Is there an alternate printer driver that does not use the aux memory?
Or is there a patch to BUFFER.DVR to prevent it from using the aux memory. BUFFER.DVR works just fine without the auxiliary memory on machines without the extended 80-column card. It buffers in the leftover part of main memory. So it presumably could be patched to ignore aux memory altogether, but the README.WS file does not give a clue as to how to accomplish this.

With these questions in my mind, I said to myself, "nothing ventured, nothing gained." and decided to try it anyway. To my surprise, it seemed to work! I put things in the ramdrive, and got them back intact. I queued up several small files to the printer and could still use the ramdrive. The queued files printed fine. They were obviously not being overwritten by the stuff I put in the ramdrive.

So, OK, BUFFER.DVR must be using the leftover main memory first, and only going to the aux memory as a last resort. "Well," said I, "lets really load it up and watch it rip!" So I queued up a very large file to print that should have filled up the available main memory and sloshed over into the aux memory, then tried some ramdrive activity. Still OK! "Better and better!" said I, feeling really fine. But still, that warning in the README.WS file must have meant something! So I queued up a second copy of the same print file and about half way through it, the entire system hung. Everything stopped at once. I had to cold boot to clear it up.

So the conclusion is that if I am careful not to fill up the printer buffer too full, I can use it the way I have it configured. But it would be awfully nice to have some kind of patch that would keep it from hanging if I get careless and queue up too much printer output. Also, the README.WS file should be more explicit on the subject of "installing accordingly".

Sincerely,

Rick Thomas

Actually net.micro.apple is no longer gated to info-apple, I for one
wish it was. Then we'd get some really good flames about 'for sale'
postings, and maybe even some administrative action.

I thought only the 65802 was pin-compatible. Has anyone
actually made this substitution?

>In order to address the 16 megabytes, Western Design uses the data
>bus as address bus for the half CPU cycle that the data bus is not
>used. Unfortunately, during the time, the video is busy playing with
>things.

Apple // display circuitry should be redone anyway, they should
give up on this color in even or odd column stuff. As long as
they keep the entry points for text and graphics routines the same,
most stuff should run OK.

>I believe that the MMU switches the CPU off the data bus during that time.

This seems to imply that Apple was thinking about bypassing the MMU
at some later point to get at a large bank of memory. Does the recently
accounced Apple memory card have a linear-addressing coprocessor port that
would allow a 65816 to address more than 64K without bank switching?
(The Applied Engineering Ramworks card does, is AE planning to support people
putting in 65816's in their machines by putting an extender socket which would
connect the data bus to the coprocessor port before it gets to the MMU chip on
the //e motherboard?)

If all of this is so, will we see 65816-enhanced Apple // come January?
(All the sales people tell me is that the next version of the //e
will be the same shade of white as the //c and the Unidisk drive.)

I recently purchased the Wordstar/StarCard package for my //e. My only complaint is that the documentation did not include any specific technical information about the StarCard (aka PCPI Appli-Card). I'm hoping that some of you good folk out there can help me by answering one or more of the following questions (as my two letters to PCPI have gone unanswered):

1. How can I access the Apple's main memory (specifically the ROM routines) from the StarCard? Does PCPI sell a technical reference manual for the card that gives such useful tidbits? If so, where do I write to order it? I am particularly interested in using Turbo Pascal to access the memory; any pointers in that direction would also be appreciated.

2. How can I make use of the 64K on the StarCard as a RAMdisk for use under ProDOS? The CP/M utilities disk provided the program that allowed the memory to be used as a RAMdisk under DOS 3.3, but did not include a program to produce the same result under ProDOS. I know that ProDOS allows for the installation of new device drivers, but without knowledge of how to access the StarCard's RAM, I can't get very far.

3. Is there a way I can use the Apple's main memory as a RAMdisk under CP/M? Currently, after the CP/M disk finishes booting, I have a 82K printer buffer (which is nice, but I really don't need that large a buffer). Surely there must be a way of using some of that memory for a RAMdisk.

For those of you who are wondering, I am very happy with the card. Watching Turbo 3.0 compile on that 6MHz Z-80 the first time is quite a thrill.

Thanks in advance for your help.

Lester McCann

I have a grappler II+ on my Epson mx-80, and I want to dump a high-res graphics page. The only problem is I seem to have lost the booklet over the last 2 years. I someone could give the the grappler firmware command to dump a hi-res graphics page I would appreciate it.

Thanks in advance,
Dean Espinoza

I have an Apple IIe with an Apple Super Serial Card and a USR Auto Dial 212A modem, running Apple Access II in terminal emulation mode (80 column mode). I am logging on to a VAX running 4.2BSD, trying to run vi. The Apple is losing characters frequently, giving me fits trying to remotely edit a file. The Apple blows its mind whether I am in vt52 or vt100 emulation modes.

Questions:

Does anyone know how to get an Apple IIe to talk at 1200 baud like a vt100 or vt52 (or other standard terminal emulation)?

Does anyone know of a modem card that has firmware to run at 1200 baud (80 col) that I could use with Ascii Express or some other program (might speed it up)?

Would using a regular 80 col. card (like a Smarterm II) fix the problem (and does it still allow use of a RAM card in the AUX slot?).

I know there have been discussions of this problem on the net before, but I don't recall ever seeing a working solution to the problem posted. I have heard that in 40 col. mode, Ascii Express will work at 1200 baud, but I really need that 80 col. display, and reasonable terminal emulation for vi.

Please email replies to the me and I will summarize responses to the net.

What precisely out of this large usenet network is the "Internet"?  And why are
there no objections to the forsale newsgroup then, which is used exclusively
for direct commercial gain?
I am being serious not sarcastic, I have nothing to sell personally so it is
an academic question for me.

Ok. This is from a friend...

Unless I'm completely mistaken, The Sider is a piece of junk. I read
lot's of letters on an Info-Apple net (don't remember the name...), and
all of it was VERY negative. There were many complaints of the drive
crashing minutes after it was installed, making funny sounds (grinding)
and other nasty stuff. Although the product is advertised as a well-made
product, how can one trust a hard drive for only $595?

Note that these comments are NOT those of Erik, he simply allowed me to
type on his time. Any comments about this should be sent to

     You are completely mistaken, if my experience is any guide. Before buying my Sider I had read 3 positive reviews in the magazines, and posted an inquiry to the net. Responses to this were also positive.
     I've now owned my Sider about 3 months, and its performance has been flawless and as advertised. I might add that my system sits on a rather rickety metal table which is easy to bump and shake with one's knees. Despite this, I have never had even a transient failure of the drive, much less a head crash. Incidentally, when I first formatted it, the formatter reported *no* areas as bad, and needing to be locked out. How many of you with hard drives can make that claim?
     I have no connection with First Class Peripherals other than being a satisfied owner of a Sider drive.

I recently posted some TASC questions related to interrupt handling. In this message I suspected Microsoft's TASC compiler to interfere with interrupt processing.

My apologies to Microsoft: The problem was my own, and happened when I ported the code from the interpreter to the compiled environment. Thanks to those who replied -- some of you came very close to the real problem.

> m and x bits in status register), E (emulation or native mode),

and VPA and VDA (valid program and valid data address).

As to whether the 65802 will work in all apples, the answer
seems to be: to the same extent as the 65C02 has worked in
all apples, which is to say, all //e's and //c's, and some II's
and II+'s. A recent issue of "Apple Assembly Lines"
has an analysis of this problem, which is due to timing differences,
which can (apparently) been overcome by replacing some of the
parts used in the timing signal generation.

My own experience has been that 65802 has worked in both
my //e and my II+, but then the 65C02 worked in my II+ also.

The DOD Internet is the largest real network.
Its only relation to Usenet lies in the gatewaying
of traffic between the two. Someone pointed out
that net.micro.apple is no longer gatewayed to
the INFO-APPLE Internet mailing list; I don't
know why it was dropped (maybe because of such
commercial postings).

There is still the moral and practical point that
netnews postings are relayed by telephone among
zillions of sites, which must pay the phone bills.
Several of the large backbone sites have dropped
netnews or are starting to impose restrictions on
it, due to the system load and communication
expense. Under these circumstances, it is
inappropriate to clutter technical newsgroups
with commercial advertisements.

Usenet has no equivalent of the Internet traffic
monitors, so is reliant on the cooperation and
common sense of its users. Some of us are
skeptical about its long-term viability..

According to my spec sheet, it is indeed pin-compatible. The data
bus doubles as the high eight bits of the address bus during the
time that a "normal:-)" 6502 wouldn't be using it.

>>Unfortunately, during the time, the video is busy playing with

If you redo the video circuitry, you may as well trash your Apple,
since all you're using at that point is the keyboard, slots and
power supply. I was thinking of putting a 65816 on a board and
running it at 4Mhz, or faster if possible and using the 6502 as an
i/o processor. I would like to be able to let the 65816 handle the
video display, because it's got such neat tricks built in, like move
a block of memory, etc, but I can't think of a neat way to do this without
slowing it down to 1Mhz. Perhaps a wait state while the 65816 was
addressing low memory would do the trick (slowing it to only 2Mhz).
The disk drives would have to be handled by the 6502 (it would be
preferable, too!).

     Dick, your trick is quite impressive!!!! Although I had to read your
instructions two or three times, your solution became very clear the last time
around.

Anthony.

I'm writing this question for a friend with an Apple IIe who is not on the
network:

He has an Apple IIe with 128K Ram, a Grappler Plus interface (w/ 16K
buffer) and an Okidata 92 printer. He is having trouble using his system
with Appleworks. Specifically, he cannot configure Appleworks properly
for his printer/interface combination. He wants to set the Okidata to
Correspondence Quality mode, but Appleworks prints 80N on both the screen
and paper whenever he tries to print. It sounds (to me) like Appleworks is
sending an initialize command to the Grappler card thinking that it is an
Apple parallel printer interface card.

Does anyone have experience with using Appleworks with a Grappler card?
(He is using Appleworks version 1.0). Any assistance would be appreciated.
Please send responses to me by Unix-mail or post to the net.

Thanks.

640K bytes of RAM is becoming more and more desirable on PC's today. The extra RAM can be used as a RAMDISK, especially for floppy-disk PC models. (You can zip along faster than a hard disk in some applications). Many programs these days are memory-hungry and can use (or may need) a lot more than 256K bytes RAM. Now that cheap RAM upgrades on the motherboard using high-density 256K chips have become commonplace, it would be interesting to find out on just which models of which computers it is feasible to do so. I would think that at least two conditions need to be satisfied:

1. The motherboard should have sockets into which the high-density chips can be inserted. For example, the motherboard might have 128K bytes of soldered memory and eighteen empty sockets for additional RAM. If you insert 18 low-density (ie. 64K-bit) chips, you will get another 128K bytes of RAM (2 of the 18 chips store parity bits; the remaining 16 chips make up 16X64/8 = 128K bytes of RAM). If, on the other hand, you insert 18 high-density (256K-bit) chips, you get another 16X256/8 = 512K bytes of RAM. If the motherboard comes with low density chips in the sockets, you can pull them out and replace them with high-density chips for under $60 total cost. If all the RAM in the motherboard is soldered, and there are no empty sockets for additional RAM, that particular model of that PC cannot be cheaply expanded - you will need an expansion board.
2. Having put the extra memory in, you have to be able to tell the computer that it now has that extra memory. This usually involves changing the settings of dipswitches on the motherboard. You have to know which dipswitches to set and how to set them. If the PC manual doesn't tell you that, you have to experiment, or ask a friend, etc., and it still may not work.

I would like to hear from the net regarding which PC's (and which models) have socketed RAM and support cheap RAM upgrades, and whether the dipswitch (or other) settings required are mentioned anywhere. I will summarize and post to the net.

I'm posting this instead of mailing because I think it may be of general
interest. I ran across the same problem with a C. Itoh Prowriter 8510 and
otherwise identical setup. I solved the problem by searching the Appleworks
program disk for the pattern "80N" and replacing it with "000". I'm told
that you can take your dealer and he will fix it.
                                Karl

The 16k ramcard approach is the easiest, and the card can be handy for
other environments that use the extra ram. You should be aware, however
that not all applications accept a language card in place of ROM. I
have integer basic in ROM and a language card, and only about half of
the software requiring a "][+" will work with this configuration.
It's usually not a problem if you check BEFORE buying software to make
sure you can return it, but it can be very frustrating to learn that
you can't run some great new program. I have gone looking for new
ROM's in the past, and apparently you CAN get them through a dealer,
but the price was totally unreasonable when I asked about it. (Each
of 8 chips is priced at some high "repair part" cost.)

No problem, Larry. Character #4 (Cntrl-D) is the cue for Disk access. Any
command you wish to use you simply put "print <Cntrl-D variable or symbol> .."
at the front, and it should work.

Summary:

[Is this bug long gone?]
    Hey! Believe it or not, here's a question about terminal programs that's not: 1) where can I get an Apple ... termcap *OR* 2) why doesn't (program X) emulate a braindamage300 correctly (and if I'd *bought* my copy would the manual tell me how). (Although this question is of equally general (un-)interest.)
   I am using an Apple II+ with a very weird keyboard attached. It has all the funny characters & a shift key, but is upper case only. Lower case entry is achieved via the "shift-key modification".

   My problem is that when running Ascii Express on this machine, as soon as it sees a character not normally available on a plain UC-only keyboard, it assumes the keyboard is a true uc/lc keyboard. Is there any fix to this? (The manual does not help with this rather obscure problem. Please, don't tell me to have my employers buy a new keyboard.)

OK. I give up. Will somebody please explain what the difference between the various color input types are. What is the difference between RGBI digital, RGB analog, and NTSC composite, and all the rest. (The Apple RGB Color card produces something called XRGB, what's that?)

Thanks for any light you can shed!

Your problem is with the configuration of ASCII Express. Make sure that the option "lower case wire installed" or something like that is set right. I use AE with the Rev 7+ keyboard encoder modification to give me an upper and lower case kybd on my][+. You can also use the one wire shift key mod. Read the section of the AE manual about the configuration options and it will give you information about how to set the parameters for the shift mod that you have if you have a //e it might be that you have told AE to look for the][+ one wire shift key mod instead of the //e's full ASCII keyboard. Also, try to "80 column firmware enable" or something like that. It is usually best to turn it off and let AE use the keyboard without the 80 column board filtering (and possibly converting cases). Hope this is helpful.

/***** isucs1:net.micro.apple / panda!jgc / 3:14 pm Aug 30, 1985 */

     I have seen a few articles in using Ascii Express to set up
some Vt52 terminal simulation. There has been reference to using 5 &
6 to set this up. I'm not quite sure what this means. I have this soft-
ware but I don't have the manuals. I'd appreciate it if someone could
explain how to set this up. I'm looking for a Vt100 or Vt220 setup. I'm
also confused in setting up the software to autocall and autolink. Thanks
in advance!

                        jc
As far as I know there is no way to emulate the VT100 with AE Pro (possibly
the only major complaint I have about it) You really MUST have the AE
documentation and read it in order to understand how to use the AE terminal
emulation and many other features.

P.S. It is not wise to admit you don't have the manual or people will flame
on you. Piracy discussions are frowned upon here.

Our Campus owns 25 Apple][/+ and][/e computers, and for reasons we won't go into now, the small arm which actually detects the write-pritect tabs existance has broken off (worn out ... whatever) on about 1/3 of our drives. After consulting with our local Apple dealer, I find out that the small black plastic arm can not be independently replaced, but would require the replacement of the whole bottom of the disk drive (at $100 each !!!!!).

IS THIS TRUE ??? If anyone out there knows if it is, or a quick solution to the problem, I'd appeciate the info. It seems to me that you should be able to jerry-rig the thing to work, but I'd rather like to have more opinions.

Thanks in advance,

RGB ... red, green, blue. A separate wire for color signal. There
may be a separate sync signal or it may be overlaid on one of the color
signals.   RGB analog is just that. The Sony profeel monitors put schmidt
triggers on the RGB inputs which shape them into either zero or one values.
NTSC is what your TV set use (nick named Never The Same Color). It is the
method of composing all the colors into a single video signal that is also
compatible with Black and White monitors. They do this by making the primary
signal the black and white intensity, and then have some side signals for
the color. Look up "color" in Foley and Van Dam.

Question, Apple II[+-], workings of 80 column cards.

Scenario:
You enter the monitor. Call -151. You type 3^P return with your 80 column card in slot 3. The monitor pokes locations $36 and $37 with $C300. It displays the prompt with a call through $36. $C300 gets executed. Among other things, the ROM code at $C300 selects the 80column video display. Your screen flips. It pokes location $36 with the usual entry point for output characters. (like 07) It also pokes $38 and $39 for the input routine that will allow lower case and other things. The monitor works like a champ in 80 columns, but you have lost your hook to DOS. 3EAG fixes that.

Now here is the big if. If I have ROM selected in the upper 12K and I do a 0^P or a PR#0 the screen gets flipped back to the 40 column mode. If I have RAM selected it fails. The $36-$39 vectors are set properly, but the 80 column screen is still showing. Assume ROM and RAM have the same code in them.

Question:
Is the above scenario a hardware bug in my cheapie 80col card?
Or more generally, how does the 80 column card know when to flip back to 40 column mode since a PR# or a 0^P only pokes the $36 through $39 bytes? Is it actually monitoring the bus?
Or is its input routine scanning the input?

I'm baffled.
Any ideas?
Thanks.

Jeff Hagen

HELP! I have an Apple Super Serial card that I'm trying to use with an external modem. My system consists of a //e with extended 80-column card, the super serial card, and a parallel printer interface.

When I put the Super Serial into dumb terminal mode, two things happen:

1. With nothing connected to the D25 connector, and local echo enabled, all appears well in 40-column mode. But if the Super serial is put into dumb tty mode using 80-col. mode, the cursor always remains in column 2 of the current active line. Aside from this, all else seems normal -- but with no cable attached.

2. After entering dumb tty mode (and verifying it using local echo), I connected the modem (VADIC 34xx, VA212, US Robotics -- doesn't make any difference) using a "standard" cable. I've been using said cable with my dumb terminal and no problems, so I don't suspect the cable -- I can loop back TXD to RXD without connecting DSR or DTR and actually echo to the screen of the //e. But connect a modem (who will assert DSR), and the Apple is now a very dumb terminal! It does assert DTR, but will not respond to keyboard input -- my last test involved using the modems loopback capability, so anything sent should have been echoed.

Questions:

1. Has anyone seen this problem?
2. Has anyone used a Super Serial successfully with a //e?
3. Is DSR killing me? If so, WHY?

So far all I've gotten from my dealer is a $25 bill for "Warrantee service -- No problem found"(!), and "it's probably your configuration". Since my box was purchased as a complete system, I've got to thinking -- Do they run diagnostics on these things? Doesn't "configured for use with modem" mean configured for use with a modem?

PLEASE, if you have any solid information -- send it my way! At the moment I suspect that I'm going to run into the "Well, we found a problem -- but you're 2 days out of warrantee" syndrome. Grrrr.
(Sorry about the editorial comments, but if net-people won't listen, who will?)

 Your users probably realized that breaking off the write-protect mechanism
allows them to write on both sides of a floppy disk without punching a hole
in the disk's other side (this has nothing to do with the original question,
 but it is most likely that the write-protect did not wear out.)

Summary: Answers to the RGB / RGBI question

In article <577@sftig.UUCP> rbt@sftig.UUCP (R.Thomas) writes:
>What is the difference between RGBI digital,
>RGB analog, and NTSC composite, and all the rest. (The Apple RGB Color
>card produces something called XRGB, what's that?)
>
>Thanks for any light you can shed!
>
>Rick Thomas
>ihnp4!attunix!rbt

TTL or RGB digital refers to a video source of three signals, RED, GREEN,
and BLUE, each of which has a digital signal level (0 or 5 Volts). RGBI
digital adds a fourth bit, INTENSITY, which is also a digital signal.
Hence, RGB digital gives eight colors, whereas RGBI digital produces 16.

RGB analog is also a video source consisting of three signals, RED, GREEN,
and BLUE, but in this case, the signals are analog voltages from 0 to 1 volt.
With analog RGB, you can theoretically get an infinite number of colors on
the screen, but most analog systems are limited by the size of the digital
to analog converter inside.

NTSC composite is standard composite video, combining the red, green, and
blue signals into one. Most video cassette recorders output NTSC composite.
NTSC video is usually output through a RCA phono jack on microcomputers.

Generally, the signal quality is degraded when the signals are combined for
NTSC video, and therefore, any kind of RGB is preferable.

A friend of mine who is a facilitator at a nearby high school has been given a bunch of Apple IIe's and told help teachers make use of them. Does anyone know of some high quality educational software that could be used in advanced high school classes? I would really appreciate any suggestions.

I'm posting this for a classmate.

Well into the Apple IIe version of Masquerade:

He has the razor (it is sharp and it cuts)
The note says "If you're sharp, you'll take the shortcut around
the block?"

Given that, WDIDN (What Do I Do Now)?

Considering the spoiler nature of the question, and the fact that I personally
will be scarce this month, mail is preferable to posting.

> but with no cable attached.
>

Your problem #1, dumb terminal mode on the SSC in 80 col mode leaving the cursor in col 2 all the time is a 'known problem' with no fix. I called Apple tech support in the Boston area about a year ago (When they were still answering the phone if you had patience enough to get thru.) and asked them about it, and they said it was a problem in the SSC/80Col firmware, and a firmware fix might be available sometime in the future, but dont hold my breath. I have not tried the IIe upgrade kit (sells for 70 dollars and makes the IIe firmware compatible with the IIc.) You might try that and see if it fixes the problem. However, You will find that the dumb terminal mode in the SSC firmware is less than perfectly satisfactory even in 40 column mode (Where it works, more or less, as the designers intended it to.) There are no cursor addressing features. But worst of all, it will not operate at 1200 baud. It drops characters. The reason is that the firmware that does screen scrolling does not poll the SSC for input (how could it, it doesnt even know you have an SSC, let alone what slot it is in.) and it takes longer than one character time at 1200 baud to scroll a 24 line screen. So you get dropped characters. It works ok at 300 baud, but who wants a 300 baud 40 column terminal, with no cursor addressing?

The IIe enhancement kit is supposed to speed up the scrolling firmware enough so it does not drop characters at 1200 baud anymore (Part of that is that the kit includes a 65C02 processor, which is a little faster than the 6502 that comes standard with the IIe. And part of it is that they rewrote

the scrolling part of the firmware to make it faster.) But it still doesnt
do cursor addressing.

My advice to you is to get a copy of a good terminal emulator program.
They all do their own scrolling, so they dont have the character dropping
problem.

AE-Pro is highly recommended by many folks. (I dont use it myself, because
I have a beta test version of a program written by Ken Adelman at Cal Tech,
which will be available public domain in the near future, which meets my
needs very well, and AE-Pro costs about 90 dollars -- less than that
mail-order, I think.)

> 2. After entering dumb tty mode (and verifying it using local echo), I
> connected the modem (VADIC 34xx, VA212, US Robotics -- doesn't make any
> difference) using a "standard" cable. I've been using said cable with
> my dumb terminal and no problems, so I don't suspect the cable -- I can
> loop back TXD to RXD without connecting DSR or DTR and actually echo to
> the screen of the //e. But connect a modem (who will assert DSR), and
> the Apple is now a very dumb terminal! It does assert DTR, but will not
> respond to keyboard input -- my last test involved using the modems
> loopback capability, so anything sent should have been echoed.
>

Regarding your problem 2, if you dont have a breakout box, get one. Once
you have one, read the manuals that come with *both* the modem and the SSC
very carefully to figure out what signals they need, and when they need
them, in the hand-shaking process. A breakout box that shows all three
states of a line (High, Low, and Floating) is much more useful than one
that shows just two states (high and not-high).

The SSC comes with an excellent manual, complete with listings
of the firmware and circuit diagrams. (The *old* Apple Inc approach
to the world. *Sigh* Gone for ever!) Make sure you have the
switches set correctly on the SSC, and make sure you have the 'null-modem'
block set the right way. Remember that digital loop-back will appear to
work, even if you have the null modem block in wrong, because digital loop
back is supposed to connect TXD to RXD. With the null modem block in
wrong, it connects RXD to TXD, which has the same effect as before. Analog
loop back, on the other hand, will not work if you have the null modem
block in backwards. The SSC manual is very clear on this subject.

There are a bunch of switches on the SSC, and they all must be set right for
it to work. Pay particular attention to things like 'bits/character' and
'number of stop bits'. The only way to get them right is to experiment,
unfortunately. But they can be frustrating, because they *almost* dont
matter. You will get occasional (or frequent -- depending on how far out
of line you have the switches) garbage being sent if you have them wrong.

Beyond that, I have no suggestions.

> Questions:
>

>   1. Has anyone seen this problem?

Yes, I fought with the same problems myself about a year ago.

>   2. Has anyone used a Super Serial successfully with a //e?

Yes, I was finally successful.

>   3. Is DSR killing me? If so, WHY?

I don't think so.

>
> So far all I've gotten from my dealer is a $25 bill for "Warrantee
> service -- No problem found"(!), and "it's probably your configuration".

What did you expect from a dealer? Most of them dont know as much about
computers as the average 12 year old. Their expertise is in retail sales,
if they have any at all.

> Since my box was purchased as a complete system, I've got to thinking --
> Do they run diagnostics on these things? Doesn't "configured for use
> with modem" mean configured for use with a modem?

Diagnostics? You gotta be kidding! (Sorry, I wax cynical.)
Actually, though, if you bought a 'complete system' and have your
specifications in writing, you might consider telling the dealer to take it
back unless he can make it work to your written specs. That usually gets
their attention.

>
> PLEASE, if you have any solid information -- send it my way! At the
> moment I suspect that I'm going to run into the "Well, we found a
> problem -- but you're 2 days out of warrantee" syndrome. Grrrr.

Couldn't you also just install a switch to enable/disable the write control
line? This would fix your problem without getting a new plastic gizmo.

I couldn't believe it, so I just opened up one of my drives. Sure enough,
the little plastic arm is part of the entire black case (front) of the
drive. It works by having the arm attached by plastic so thin there as to be
flexible (this is the part I'm sure that broke). The arm then touches the
actual write-protect switch.

I can't think of an easy way to replace this, but I'll pass on
an idea that a friend of mine came up with which works real well.
He has added an extra switch to the front of all his drives. The
switch is single pole, double throw with center off. The way it is
wired is as follows. One position, say up, is connected through the
regular write protect switch and thus functions as an ordinary drive.
The other position (down) bypasses the original write protect switch
and thus the drive will always write regardless of the write protect
tab (real handy for using the back sides of disks if you don't have
a hole punch). The center off position is an open circuit and thus
is the disk is always write protected. This solution in your
situation doesn't provide the exact original functionality, but
will give you a way to write protect disks (center off), or write
disks (down).

I wish to modify my statement slightly. After closer examination of my
drives, it appears to me that the plastic switch is a separate piece
that is attached to the black case (by glue? I'm not sure, I didn't
want to break my switch :-). So, I guess the posibility exists to
replace the switch by itself if you can find another one and get
the remains of the old one detached from the case.

Any kind soul out there got Kermit onto their Apple?
I want it and have the distribution but have been
warned that the booting procedure for the Apple is
horrible. If you have done it send me mail and we
can discuss how I might get a copy of your disk.

I have a 2e with the 80 columns but without the extry
RAM. The interface is a funny one (from Pure Data -
love that name...) which maybe can be coerced to look
like an Apple Communications Card for Kermit's
benefit. I don't have a Z80 card.

A simple question, if you know the answer:
What is the printer interface like on an Apple III (not II)?
Something nice like RS232 serial or Centronics parallel?
Or awful like the Mac and K-mart class home computers?
My wife's church had an Apple III donated, and they need a
letter-quality printer.
     I don't need printer recommendations so much as just
the lowdown on the interface. If it's something standard,
then choice of printer is unlimited; otherwise, what does Apple
charge to take one out of their museum?
     Please respond to ihnp4!ihexp!knudsen. Thanks, mike k

>Something nice like RS232 serial or Centronics parallel?

The Pkaso/U is a nice parallel interface printer card which
works in the Apple III (or Apple II, II+, //e).

In Applesoft BASIC on my Apple //eE (ProDOS 1.1.1)
I have been unsuccessfully trying to read TXT characters
from one Disk file apply a little logic, and write the
transliterated characters to another Disk file. What's
the glitch? For example: [D$ = CHR$(4)]

```
     PRINT D$;"OPEN <in file>"
     PRINT D$;"READ <in file>"
     GET C$
     [check and possibly translate]
     PRINT C$;
     [loop back to GET until EOF]
     [on EOF CLOSE file(s)]
```

The above works as expected; prints the TXT file to
the screen just fine.

```
If   PRINT D$;"OPEN <out file>"
     PRINT D$;"WRITE <out file>"
```
is added ahead of the GET statement, the program only
responds to C$'s entered on the keyboard. It's as if
the OPEN/READ, which previously worked, is ignored due
to the addition of OPEN/WRITE. Characters entered on
the keyboard are buffered and eventually written to
the <out file>. I have seen no prohibition of this
READ/WRITE GET-PRINT in the manuals. Am I missing
a simple workaround, short of Assembler routine(s).
It's not another bug in ProDOS, surely.

Apple/// printer interfaces are generally pretty simple.
There is a dealer program floating around called
"Drivers Aid", which has most of the popular drivers
for any peripheral on it, and it is menu driven.
I use a NEC 7700Q spinwriter, I know people using
virtually any name-brand printer. I've been hearing
very favorable commentary on the Star Geminis, Qumes,
Epsons, Necs, Brothers, etc.
  Contact Apple Three Users of Northern Calif.

My poor disk][drive lost its write-protect sense the same way two years ago, and I didn't mean to do it. Just fell out when it got too strained, I supposed.

Anyway, just string in a SPST switch through the line where the microswitch used to be hooked up, (after disconnecting the now useless microswitch) and you'll find that when connected, your drive will be able to write, and vice versa when the line is open. String the wires out through the back cover of the drive on top of the ribbon cable. I've been working with this arrangement for a while, and I like it better than the old way. One can write all over disks with no write-
protect notches, and one can switch on the write-protect switch for a feeling of security.

>flexible (this is the part I'm sure that broke). The arm then touches the
>actual write-protect switch.

This same thing happened to a friend on mine, and I can see how it could happen to any Apple that is used by a large number of "uncaring" users. The way that these little black swiches are torn out suggests abuse by users. It may not be the case every time, but...

Anyway, it seems that these switches get torn out when someone yanks a disk out of the drive quickly. They write-protect notch gets caught (the poor thing
can't "get out of the way" fast enough) and breaks the switch. It seems logical that it would get caught more often on home-made w-p-notches, because they are usually more ragged than the normal ones. Also, sticking *too* many of those write-protect stickers on the disk, making the disk too big to fit in the drive, also causes these switches to become caught on that gooey stuff left over from the n-th replacement of such stickers.

If I ever had to run a lab with many Apples used by many students, some less considerate that others, I would stress the *careful* removal of disks, and the inspection of the notch area before inserting the disk. I have had my Apple a good five or so years, and have never had any troubles.

I wish people would READ this newsgroup and not just post
requests to it. The issue of Apple termcaps has come up
repeatedly. The answer is, IF you are just using the
built-in ROM firmware to display characters, then you are
going to have a hard time using the Apple as a terminal
with "vi" and other termcap/terminfo-using programs. This
is primarily because of the lack of a real carriage-return.
80-column Apples have problems keeping up with higher baud
rates (they lose incoming data while scrolling). The new
Enhanced //e and //c ROMs are better about this.

The ONLY satisfactory way to use an Apple II as a terminal
is to run a terminal emulation program on it. Many of the
communication software disks that come with plug-in modems,
as well as communication software that can be purchased
separately, act as terminal emulators. Usually they
emulate a simple, well-known terminal such as an ADM3A or
VT52. The instructions that come with the software should
tell you what terminal is being emulated. Set your UNIX
TERM environment variable to whatever is being emulated.
If you stole your software and therefore have no
instructions, tough -- don't expect sympathy or advice.

I have posted an 80-column Apple //e termcap entry several
times and will not repeat it at this time. It is for the
RAW Apple (built-in ROM display firmware) only, and as I
said this mode makes an unsatisfactory display terminal.

     I had the same trouble. I just gave up. At 1200 baud, my
80 col. board just couldn't handle the data coming in. I suppose it
would work at 300 baud, but VI at 300, euch!
     About the vt52 problem: Go into the menu to make a macro,
pick emulation ON, and 5 for input, 6 for output. (if this doesn't

work, just switch 'em) Save the macro. Write the little text file
MACRO.LIB the way they say in the docs (if you don't have them,
leave me e-mail, I'll be more specific), and then boot AE. Load in
the macro, then call UNIX...

```

i have run across a problem when i use ascii express or ascom (under cp/m) to talk to unix at 1200 baud. i frequently lose the first (in ae) or second (in ascom) character. this doesn't happen at 300 baud and no other characters are lost. i am currently operating with an emp 1200b modem but will be changing to a smartteam modem within the week. my serial card is the apple super serial. i am still running 40 columns and find that the problem occurs every time thaty the left side of the screen is reached (i.e. at the start and dead-centre of lines). any suggestions?

    This is a question about the way a shift-key mod would be done on
a Apple][+ purchased in August 1981. This enables use of the shift key
with software/hardware that handles upper and lower case ASCII characters.
I have an 80-column board in Slot 3. I have heard about very simple
ways to enable the shift key, but need a specfic recipe for one. Do all
of these involve attaching a jumper between a pin on the keyboard
controller and the game i/o controller? My game port currently has a
joystick attached.
   Thanks, in advance, for any help.

Summary:

I've just bought yesterday the new game from Electronic Arts called
SKYFOX, it's really an impressive game.

First of all it's a combat simulation where you have to save your base from
the enemies who want to destroy your base. You have 15 scenarios (ranging from
training mission to massive onslaught) and 5 skill levels (from cadet to
Ace of the Base).

The animation on the machine is fantastic and very, very fast. The colors are
great, the sound track is good (you have music in the beginning and after
that sound effects) .

You start by choosing a scenario and a level, and you are on your way.
The first 7 scenarios are training ones and the other ones are actual attacks.

The game has the following features:
- Auto pilot to the enemies
- Help with your fight
- Radar view
  - View from above
  - View forward
- Guided missiles
- Heat seeking missiles

You can go up to 3000 MPH which is very,very fast. An example: as cadet
on the tank training 1 (lowest level) you go up to 200 MPH and it's very fast

Tanks will shoot you from below and planes from above, but you will only fight
one of the two because the tanks are on the ground (of course) and the planes
fly between 30 000 and 40 000 feet in the air . So you have to use your
afterburners to get you up there.

You have five skyfoxes (lives) but you can abort the game at any time.

Your onboard computer is really nice but hard to use in the beginning,
(I've only had it for 1 day) but is really helpful.

All in all the graphic are excellent and reasonably priced: $39,95 CDN
for the commodore 64 version, I think the apple version is the same.
which is a very good price. I highly recommend it to all gamers because
even though I don't really like arcade games, I love this one.

In article <141@pyuxv.UUCP> craig@pyuxv.UUCP writes:
>In Applesoft BASIC on my Apple //eE (ProDOS 1.1.1)
>I have been unsuccessfully trying to read TXT characters
>from one Disk file apply a little logic, and write the
>transliterated characters to another Disk file....

You should be aware that DOS (whether it is 3.3 or ProDOS) only knows how to perform an operation on one file at a time, although you can have as many open files as the DOS MAXFILES command allows.

Example:

Read in 100 characters from F1$, transform, and write to F2$, where F1$="INFILE.TXT" and F2$="OUTFILE.TXT", or any other strings that turn you on.

This works because DOS only knows how to "WRITE" until another DOS command comes along. Likewise, DOS only knows how to "READ" until another DOS command comes along.

```
  .
  .
  .
1000 REM READ & TRANSFORM
1005 D$ = CHR$(4)
1100 REM OPEN FILES
1105 PRINT D$; "OPEN "; F1$
1110 PRINT D$; "OPEN "; F2$
1200 REM READ, XFORM, & WRITE
1210 FOR I = 1 TO 100
1220 PRINT D$; "READ "; F1$: REM THIS NEGATES ANY PRIOR READ OR WRITE
     STATEMENT
1230 GET C$
1240 GOSUB 2000: REM TRANSFORM C$
```

```
1250 PRINT D$; "WRITE "; F2$: REM THIS NEGATES ANY PRIOR READ OR WRITE
     STATEMENT
1260 PRINT C$;
1270 NEXT I
1280 PRINT D$; "CLOSE "; F1$
1290 PRINT D$; "CLOSE "; F2$
  .
  .
  .
2000 REM TRANSFORM C$
  .
  .
  .
2099 RETURN
  .
  .
  .
```

Another Example:

Read in 100 characters from F1$, transform, and write to F2$,
All the time writing to the screen what is coming from F1$
where F1$="INFILE.TXT" and F2$="OUTFILE.TXT", or any

A friend needs a communications program to connect an Apple][+
via modem to a main frame. Nothing fancy - but he does need the ability
to send and receive external files. We'd be grateful if anyone would send
us a public domain source in BASIC that can do it - or let us know of any
inexpensive sources.

Thanks very much.

*** REPLACE THIS LINE WITH YOUR MESSAGE ***
I have an Apple //e with a Super Serial card and have found a way
to use a Prometheus Promodem at 1200 baud without any characters
dropping. The problem wasn't the slow firmware in the card, but
rather the way the card didn't work with my 80col card. The solution
was to use a Microsoft Premium Softcard //e (Z80 processor, 64k addit.
memory and an 80 col card all on one huge board) as my video interface.
For reasons unknown to me, this configuration works perfectly!

     Feel free to mail me with any questions regarding dip switch
settings, cables, modem configs. or anything... I've spent two years
trying to get to this point and I might be able to help. Keep trying,
it feels great when 120cps fly across your Apple screen!

One of the best things you can do for high school kids is to introduce them to real uses of computers: word processing, spreadsheets, file managers, telecommunications. So it wouldn't be a bad idea to get something like Appleworks which covers some of these functions. Programming is another obvious application.

As far as educational software goes, let me recommend two programs: Rocky's boots from The Learning Company (if they're still in business) and Green Globs from Conduit. The former deals with digital logic (albeit not in a form faithful to real digital circuits). The latter deals with graphs of polynomial functions. Both are in game formats that require active and creative thought about the subject matter.

Excuse me if this is trivial, but I'm new to Apples:

I am using an Apple IIe and I need to dump the screen to the printer. I have a binary program that somebody else wrote to this. It works fine - except that the dump it produces is not big enough. I would like the screen to fill the entire width of my Epson MX80 printer, at the moment it fills only about half the width.

Is this just a simple printer switch? Does the Apple have to repeat each pixel? Does anybody out there have a program which will produce full width o/p? Would they like to send it somehow? I would be most grateful.

Thanks, Mike.

I am posting this for a friend, so please do not respond to me
---

A computer software company is looking for a top-notch programmer
to translate a text adventure game (based on Star Trek) written
in C from Apple II to Commodore 64.

Very high pay, possibility of royalties.

Start immediately, 3-4 week project.

Lines: 19
Summary:

DOS circumvents most of the properties of the normal system I/O. In particular, it requires that the input and output hooks in $3[6-9] point to DOS rather than COUT or whatever. So 3^P screws this up because it changes them.
You should do a PR#3 instead. Even from the monitor. PR# is a basic command, yes, but it is also a DOS command. And that takes precedence when DOS is installed. DOS will change its own hooks to the 80-column card, but leave the monitor hooks pointing to DOS so that DOS gets first crack at all the I/O.
And from a basic program, you should do

```
PRINT CHR$(4);"PR#3"
```

not

```
PR#3
```

. And from an assembly language program you should output the sequence PR#3^M to $FDED.

I personally have worked with TASC, Einstein, and with SpeedStar and found that Einstein is probably the best. As you stated though, It's no longer being sold. Oh well. However I'll tell you why I like it over TASC.

The TASC compiler runs through a three stage compilation, first it check for bugs or errors it the program that it can't compile. Then it ,if there are no errors, starts compilation (stage 2) and third it compacts the code and writes it to a file.

This file is a binary file and can only be BRUN after another file RUNTIME has been BLOADed into memory. This is a real pain!!!

Einstein however completes compilation in one pass (and also will compile commands such as graphics) that TASC has problems with. After compilation Einstein writes the compiled file as a fake APPLESOFT file. In other words it fool the computer into thinking that the compiled file is really in BASIC. It sort of is. If you try to list it you will see only one line, that looks like this:

```
CALL XXXXXX
```

What this means is that the compilied program resides about $805 in memory and that the program CALLs it. Much more effiecient. and its faster!!!!!

If you get desperate I may be able to up load the Einstien File. (I deprotected my original so that I can load my file, then BRUN Einstein, then save the new file. Its so much easier than the other way.

Manx software systems has an MS-DOS editor called Z which is a
close copy of VI. A friend of mine has it and is extremely
happy with it.

Manx (800) 221-0440

Mac C & APL
By J Fields

While Macintosh seems to be the computer for the rest of us, what about all of the people who are use to the run-of-the-mill type of old standard computers? What about people who like the usefulness of business languages like COBOL for coding business programs, or the speed and compactness of machine language for requirements that are speed or space critical? Fortunately, new tools are coming along. In recent months we've seen the arrival of both high-level languages like Basic, Forth, and Pascal (perhaps we'll even see COBOL soon); as well as machine level tools like MacASM for getting down to the nitty-gritty bits. (MacASM, by the way, is pronounced MAC-A-S-M with 'asm' spelled out so it doesn't sound like something out of Master's & Johnson's....)

My own observation is that the MAC is turning out to be a very good platform to implement both high-level and low-level tools on. Not only is the Mac user interface appropriate for writers of executive memos and high-tech scribblers, but it also lends itself well to programming -- I no longer have to write the same code twice. The first language to show me this was HIPPO-C.

Level one of Hippo-C comes with a well written and easy to use tutorial. How many languages have you learned by trudging through the books entering sample programs one at a time by hand? With Hippo you can cut and paste the samples right out of the tutorial on your screen. Want to experiment? Well, you can use many of the same editing techniques you've been using in popular word processing programs to modify the sample programs. So, instead of the program printing out Chris Somebody's name on your screen it can print out yours, or perhaps some favorite salutation, "Damn the torpedoes...."

Today something new and exciting came along. Dr. Jerry Brenan, who works in the University of Hawaii's Psychology department, introduced me to APL on the Macintosh. This was particularly exciting because I've not even seen

APL advertised for the Mac, and did not know it was available. Don't all software producers start advertising months in advance of product availability?

Now, if you're like I was before I knew about APL then you're probably sitting there asking yourself to reconsider your initial decision to read this particular article. Such would have been my reaction at the very mention of a 'new language.' The minds and bodies of programmers seem to develop some sort of defense mechanism with time.

"We are not going to suffer these long hours while you learn every new thing that comes along." they seem to say.

They may have a point. After all, you've hardly touched that 'good ole' MDL-2+ after the time you spent learning it (never mind what it cost -- the investment you made, the backup disks, and the surprise upgrade to super-duper version 1.2XXX-rev. A to mod. II). Still, APL is worth checking out. It might just knock your socks off.

APL stands for "A Programming Language." It's a language that seems particularly well suited to working with numbers. Jerry showed me how, with five or six characters, he could almost instantly fill an array with 10,000 randomly generated numbers. "Hm, seems kind of fast," he murmured. Four keystrokes later the sum of all 10,000 numbers was displayed just as quickly. It was my turn to be impressed. "Try doing that in Applesoft," I thought to myself.

Psychologists, like Dr. Brenan, can use APL to perform statistical analysis. In fact, Dr. Brenan has programmed, in APL, a statistics package called STAT 1 that runs on PC-DOS machines. He will very likely be producing it for the Mac soon judging from his reaction to the Mac. Rather than try to interpret what he presented to me, here are a few paragraphs from his brochure on STAT 1:

"STAT 1 brings powerful research tools to the office desk. It is ideal (a) as a statistics learning tool; (b) as an introduction to computer-based research; (c) as a set of statistical analysis tools. STAT 1 takes data from initial coding and documentation through printing the final analysis with titles and footnotes. STAT 1 helps the user pick appropriate statistics with its 'statistical decision tree,' and provides topical help screens at the touch of a key.

"STAT 1 is reasonably priced, easy to learn, requires no special language, and comes with a comprehensive manual that focuses on application examples. STAT 1 requires no computer programming, but presents all choices in easy-to-use menu form. The user simply selects a procedure from the menu and presses Return. STAT 1 prompts for critical inputs through each step of the analysis. The program is ideal for offices and agencies in which a number of people must analyze research, but do not have time to master complex mainframe statistical packages.

"STAT 1 provides all basic statistical procedures, beginning with simple descriptive statistics crosstabulations and data transformation, and

working through to powerful correlation, analysis of variance, and regression routines. STAT 1's full-screen editor gives the user complete control over data entry and correction. Robust data transformation procedures help correct for bias in data, and unique date-arithmetic functions provide a tool for analyzing administrative data."

There, I couldn't have said that better myself. I want to stress that Dr. Brenan also offers a text version of the STAT 1 manual that is suitable for use as an introductory text for teaching statistics. My feeling is that if you've never studied statistics, but think you could benefit from applying statistics in your work environment, then STAT 1 would be a good package to pick up both for learning stats and for later applying them.

STAT 1 is offered at $179.95 and requires an IBM-PC or a "99% compatible" personal computer with 256K bytes of memory and two floppy disk drives or one floppy disk and one fixed disk drive. It will use an 8087 math processor chip automatically if one is installed, and uses all available computer memory. To order contact me via Compuserve 76174,456; USENET ..islenet/jayf ; SOURCE CL3035; phone, 808/521-4487; or mail, c/o IDSC, 1251 Heulu St. #107, Honolulu, Hawaii 96822-3085. If you have a bankcard or can send a check I'll relay the order to a stocking dealer.

STAT 1 is an example of the usefulness of APL. If you have math intensive applications APL is probably a good tool to add to your kit bag. Other uses I can think of are for stock market analysis, financial modeling, engineering, and business management. APL comes with its own tutorial built in, a terminal program for hooking up with mainframes -- my bet is that you could use this to hook with Dow Jones for rapid-fire price analysis -- and a menu generator.

Don't overlook this last item. Have you ever wondered how programmers go about setting up the menus on Mac with all those buttons, text boxes, and icons? APL is worth getting just to see how it's done. However, you do not have to buy APL. You can pick up the free demo disk. The demo disk has all of the same features, but does not allow you to Save. If you want a copy, send an INITIALIZED blank Macintosh disk labeled with your name & address along with a SASE and $1.00 to the above address; I'll fire a copy of the APL sample back to you. The buck is to buy peanuts for the chipmunks that keep my disk drives spinning -- you gotta feed the chipmunks occasionally or they go away.

What has become increasingly clear is that the MAC is not just the machine for the rest of us, it's THE MACHINE FOR ALL OF US. Being able to learn a new language like C or APL with out laboring over the manuals is a big advantage. Being able to pull down the tutorial anytime you need to while you're in the middle of coding something is also helpful. But the icing on the cake was seeing Dr. Brenan's reaction to the MAC (I was calling him "Jerry" until I sat down to write this and discovered with alarm that he's a phd, someone I may well end up taking classes from someday, and someone who should certainly be addressed as Dr. so-and-so...).

"This is fast," he said. "This is much faster than the 8088."

-Cheers-
J Fields

I have written a program in basic, with machine language routines poked in, to check all the differences on a dos 3.3 disk. I did this to try to save an adventure character, noting the changes before and after death. I initial used peek(x) and peek(x+4096) to compare two tracks, but this was slow (1 for 34 tracks). I then checked my IIe reference books, and found the monitor Verify routine at $FE36. From the instructions, it only prints anything wh it finds a difference, but when I run my program, no matter where the buffer for the information is (within both hi-res pages) I get the output:

XFCA: GG (GG)

where X is the page number and GG is a hex digit. This is in the correct format, but since they are equal, they should not be displayed! The actual value of GG varies, and I think that it is the read in value, But still shouldn't be printed! Any ideas as to what is wrong, or what I'm doing wrong\??

Thanks,
Andrew Rahme

I'm trying to makePrint Shop work with an Apple IIe with 2
drives, the Perisoft Messenger printer card, and an Okidata
Microline 82A Printer.

The set-ups in the program do not mention this printer. When
I tried the Oki 92 printer, the configuration failed the
built-in printer test. Experimenting around, I found that
telling the program I have an Okidata Printer card with
graphics turned on works--sort-of.

It passes the printer system test.   However, in every graphic
which it prints every other line is blank: apparently an
extra linefeed is inserted at the end of every line.

The printer does NOT insert linefeeds.

How can I correct this problem? Is there another "magic"
configuration that will work correctly?

Can anyone advise me of any cheap (e.g. free) sources of Emacs
for an Apple II system (ideally running under U.C.S.D. Pascal).

(I don't often read these groups, so direct mail would be
appreciated, though I'll try to make the effort to look at these
groups occassionally).

Thanks in advance. I will also post summaries on request.

Summary: Sounds like hardware

I looked at the routine, is pretty straightforward. I can't see how you could possibly be botching the stores to A1, A2, or A4 to get the behaviour you describe. One possibility is that the 6502 is stuck in decimal mode, but I didn't think that affected the CMP instruction, which the code uses to do the compare.

The only way I can see that you would get a display with two EQUAL numbers would be if the two reads from memory, the one in the compare sequence and the one that picked up the value for display, were getting different data! This would be a hardware problem. If it is always at xFCA as you describe it would sure fit some kind of coupling between address and data lines, either on the motherboard or in one of your memory chips.

The FIRST thing to do would be to pack up all your stuff onto a disk and go visit a friend with another][e and see if the problem happens there too. If so, it is probably NOT a hardware bug. If it works fine over there, though, your][e is sick and needs to go to the chip doctor...

You could always reseat the memory chips (in fact ALL socketed chips), that will fix a multitude of weird errors like this.

Good luck

To the Macintosh XLISP users:

     Version 1.5 of XLISP will be available shortly for the 512K Macintosh and the Macintosh-XL (Lisa under MacWorks). It includes support for lexical scoping of variables, floating point arithmetic, case conversion of symbol names, quickdraw graphics (limited), a better Macintosh interface with pull-down menus for loading files, interrupting program execution, continuing from errors, etc. It also has reworked object-oriented programming support (uses keywords for message selectors and slightly different syntax for creating new classes). It also has a number of bugs from version 1.4 fixed. This version is marked with a copyright notice and is restricted to non-commercial use (I intended to place the same restriction on version 1.4 but forgot to put the copyright notices on the source files -- there is one in the oblist). If there is enough interest, I will upload the hex version of the application file and the documentation to usenet for distribution. All source distribution will be by Macintosh disk. If you really need the source code, send me a Macintosh disk and a stamped self-addressed disk mailer (not money for postage). My US-Mail address is:

Summary:

References:

I have a set of print routines for the apple IIe which write directly to
the display page (both 40 and 80 column pages). I have a lot of trouble
with dos getting lost and having to resync the head. While my routines
work ok (they are part of an editor) and dos works fine (files are read
and written without errors), I would like to eliminate the resync clatter.
I understand that dos (3.3) keeps some of its variables in the display pages
in the left-over space between the visible lines, and I suppose I am
trashing at least one of them.

The problem usually happens on long (200-400 line) files, and is decidedly
more prevalent on writing files than reading them. However, sometimes even
very long files are written without problems, and sometimes even very short
files have problems. I am using the Manx open, read, and write routines,
but I am sure their editor uses them and it never screws dos up. A very
common place to get lost is between opening and writing the files.

Does anyone out there have any ideas about specific places to look? I don't
have an assembly language debugger (all of the display routines are in assembly
language) so debugging is more by inference than a step-by-step process.
Again, the display works *perfectly* (so far as I can see, anyway). It doesn't
lose characters, so I don't see how it could be writing them in non-visible
(i.e., dos) locations. I don't know of anything else that could be causing

the problems.

A while back I posted a request for an arm-movement program for the apple IIe.
Most of the responses recommended either 1) not doing it or 2) disassembling
the dos routines. If you are really lazy, you can buy 'Beneath Apple PRODOS'
by Don Worth and Pieter Lechner. One program in the back has the assembly
language routines to do this. As a side note, this is the same program
in 'Beneath Apple DOS' by the same authors that called DOS to move the arm.
I suppose either it is much harder to do in PRODOS or they got a lot of
calls on it. Whatever the reason, it is there (I haven't tried it yet,
though).

Jove has been touted lately as a public domain editor. This is not so.
If you have the source code, take a look at "re.c", in which credit is
given to AT&T's "ed" editor for the regular expression pattern match
routines.

Jove should never have been ported to MSDOS. Any non-Unix machine
running Jove is guilty of software piracy.

The newest versions of jove (the one's without the unix code) are owned
by Unison World. I don't know what it costs, but it is available for
the PC from them.

Their is an agreement from Unison World to "jovehackers" to allow this
version for UNIX SYSTEMS only.

I suppose someone could have taken out all the ed code (it isn't hard),
but I wouldn't distribute it without doing so!

          Confirmed jove addict.

Summary: Here is the information (again, sigh)

Well, this has been posted before, and I'm *sure* it will be posted again.
Nevertheless, here's my stab at it.

The display uses only *SOME* of the memory assigned to the hardware display.
The few bytes that it does *NOT* use are assigned to the peripheral cards for
use as RAM memory. Some of the peripheral drivers (e.g. the disk driver)
saves *state information* in these locations, and if you blow away these
bytes you will confuse the driver, causing the problem you describe.

The relevant documentation can be found on page 125 of the Apple][e
reference manual, the section entitled: "Peripheral-card RAM Space".
My boss has the office][+ and all its books at home right now, but this
information *IS* in the][+ reference manual.

To avoid blowing away there RAM locations, you will have to stop saveing and
restoring display memory with a block IO from 400 to 7FF or 800 to BFF and
instead do a bunch of little IOs. First cut is to do 24 of them:

```
400-427
480-4A7
500-527
580-5A7
600-627
680-6A7
700-727
780-7A7
428-44F
4A8-4CF
528-54F
5A8-5CF
628-64F
6A8-6CF
728-74F
7A8-7CF
450-477
4D0-4F7
550-577
5D0-5F7
650-677
6D0-6F7
750-777
7D0-7F7
```

But, note that *the order doesn't matter*, as long as you read them in with
the same order you wrote them out! Some of the ranges are contiguous, and
thus the task can be simplified to 8 IO requests:

```
400-477  (rows  1,  9, 17)
480-4F7  (rows  2, 10, 18)
500-577  (rows  3, 11, 19)
580-5F7  (rows  4, 12, 20)
600-677  (rows  5, 13, 21)
680-6F7  (rows  6, 14, 22)
700-777  (rows  7, 15, 23)
780-7F7  (rows  8, 16, 24)
```

If you compare this against the table on page 125, you will see that this
IO sequence avoids the Peripheral card RAM locations...

I hate to say this, (what with all of the good reports from others...),
but I have used the MANX compiler/editor system and I cannot recommend
the "vi-like" editor as a serious word processor. It works fine for
creating C programs, but for word processing it has the following problems:

    - It has only a small subset of the vi commands, lacking the most
      important ones (i.e. "undo", magic commands like ".", etc.)

    - Since there is no character buffering, you always have to wait
      for the screen to update before proceeding (very annoying since
      it updates in a weird fashion).

    - It is "buggy" (I have crashed it a number of times for no apparent
      reason).

I have other complaints, but I gotta get back to work.

  I am going to try to phrase this question in as delicate a way as possible without giving away any secrets about ENCHANTER, so if it is vague to you then you probably can't help me.

  After playing for about a month my wife and I seem to have gotten into as many rooms as possible, just not all in the same game. The problem is that we seem to need a spell (that cannot be written in the spell book) in two places, (I hope anybody with an answer knows which places I mean) but of course when we cast this spell the scroll is destroyed and we cannot use it again.

 I don't want a complete give away, just something to let me know which room gets the spell first, or if there is another spell that might help us out (not necessarily what that spell is).

  The complexity of this 'puzzle' seems sooooo much tougher than the other puzzles that I am in need of some assistance.

     Thanks

     Mike Davis

Sorry for leaving out word about the people who make APL for Mac, and thanks to Mark & Dave for calling my attention to this omission. It was one of my primary objectives to give them some well deserved credit in the review...guess I got a bit excited and forgot. Anyway....

Apl for the MAC is called PortAPL, and can be ordered from:

Portable Software
60 Aberdeen Ave.
Cambridge, Ma. 02138

(607) 547-2918

Price is $275.00 Plus $10.00 for shipping. VISA & M/C are acceptable.

Now, if one of you wizards would send me the pill you take to learn this stuff faster :)

Aloha,
J Fields

As it turns out there is an announcement in the July 1985 issue of MacWorld
concerning the fact that Micro Focus has released (or is releasing) a COBOL
compiler for the Macintosh. Looks like you'll be able to solve the business
oriented problems after all...

Here is the header message, verbatim, from re.c in the Jove editor source
distribution:

```
/* re.c */

/* JOVE/MSDOS. K. Mitchum 1/85 */
/* Modifications for personal use only. */
/* original code J. Payne LSRHS 5/83 */
/* Ken Mitchum */
/* University of Pittsburgh */
/* Decision Systems Laboratory */

/*
   Jonathan Payne at Lincoln-Sudbury Regional High School 5-25-83

   jove_re.c

   Much of this code was taken from /usr/src/cmd/ed.c.  It has been
   modified a lot and features have been added, but the general algorithm
   is the same. */
```

Note that the original source is quoted as "ed.c" but extensive modifications
have been made. The "general algorithm" is the same, but an algorithm cannot
be copyrighted -- only the specific realization of it. It is far from clear
to me that this constitutes software piracy in any form.

I solicit opinion from the net. Is it piracy or not?

One unit not mentioned before: the Apparat Prom Blaster.
It plugs into an empty slot (If you HAVE one) and reads/writes
2708/2716/2516/2532/2732/68764/2816. If you don't need large
EPROMs programmed, at $110. it's not bad. I have used mine
for four years now, and have even burned 27C16s and 27C32s
with over 90% sucess. Apparat makes a new on for the IBM PC
that goes on up through the 28 pin devices (27256 etc) for
around $130.

Summary:

Regarding the MANX vi-like editor for the Apple II, not only
did the version I used lack some of the fancy visual mode commands,
but it dodn't even have a global replace!! As has already been
obserevd, it's bearable, but not beautiful. On the other hand, I
never had it crash on me.
  In contrast, MANX's vi-like editor for the MacIntosh seems VERY
complete. I guess they just needed some extra address space.

I recently purchased "Newsroom" from Springboard Software, and have found it
to be an excellent program. It main purpose in life is to produce newsletters,
which it does with a minimum of hassle and a great deal of professionalism.
The programmers have done an excellent job of making the program (of course
this is relatively) error-free (it has yet to do anything unexpected to me),
and quite the contrary, goes out of it's way to save you from stupid mistakes.
It prints an excellent quality copy and the tools included do the job better
than the package advertises. I recommend this package to anyone who has an
interest in printed copy or doing a small newsletter production.
  The only difficulty I had was when first attempting to print, was setting
up the configuration. There are a multitude of choices on the set-up menu,
but none specified exactly my system, which is an Apple][+ w/64k, a
Practical Peripherals GraphiCard (which was the stumb and a Riteman Inforunner
printer (Epson-like).
Despite there being some 30-odd choices, my GraphiCard wasn't there. After much

trial and error, as the local dealer couldn't help me, I found that the proper set-up for my system is as follows:

Epson FX-80
Firmware Protocol 1.0
Slot one

I hope this helps anyone having problems trying to get this excellent program up and running.

Copyright law includes the concept of a "derived work", which is a work produced by taking a protected work and making changes in it. The law says that a derived work is owned by the owner of the original work.

It doesn't matter how much you change it. You could eliminate all but one comment line, write an entire new program under that line, and it would still be the property of the owner of the original work. To make a work which is wholly your own, you must start from scratch. In other words, if you take an original source and make extensive modifications to it, the result is still regarded as the property of the owner of the original source.

The situation with regard to Unix code is made more complicated because AT&T primarily uses trade secret protection, not copyright protection. However, Unix is protected by copyright because all works are considered to be copyrighted until they are published, even if they contain no copyright notice, and Unix source has never been published.

Anyone who has access to Unix sources is supposed to have signed a form promising to protect the trade secret. A form signed by an employee promising to abide by all his/her company's rules is sufficient to bind the employee to the Unix trade secret contract. The terms of the Unix license also preclude taking a piece of Unix source, making extensive modifications, and distributing to non-Unix sites.

Since I posted the original follow-up (double ">>"s above), I received the following message which casts further light on the proprietary nature of jove:

> The problem is not the re.c code (because it bears no resemblance
> whatsoever to the ed code, although algorithms - which are well known -
> are similar), but the low-level tempfile management which is stolen
> directly from vi (in io.c). That stuff needs to be rewritten before
> Jove can be distributed to non-unix source licence sites... supposedly.

If you are looking for a serious word processor, I would recommend
Appleworks. It is reasonably fast, intuitive (unlike vi), but it
is expensive.

The EPROM programmer design that was in BYTE in february costs under $30
to build ($20 if you have some of the caps etc) and it to programs normal
and "A" versions of the 2700 family. Even if you add a microcontroller to
run it (rather than having your host computer run it) it isn't more than
$50. So why are "inexpensive" multipart programmers like the one above
$200?

*** REPLACE THIS LINE WITH YOUR RIBBON GRIPES! ***

I have an Apple Scribe Printer that I need to sell.
I got it three weeks ago, and haven't used it. Just
because I took it out of the box, it can't be returned
for full value (or half value, for that matter). It's
cute, in a word, but for my needs (typing 200 page novels)
it ain't good enough. The price I'm asking for is $180 or
the best offer.

Re: jove regular expression code

I believe technically any code derived from licensed UNIX source code
by a series of edits is considered to be constrained by the terms of
the original AT&T UNIX license. However, there is nothing magic about
the "ed" regular expression code, and one could simply lift the same
general algorithm from "Software Tools". This is perhaps a good idea..

I would like to purchase a PASCAL compiler for my
Apple IIe system (64K with 2 disk drives).

It would probably be nice if anything I bought were
"standard" enough to be ported to another system (on a mini)
without to much trouble.

Any comments on the benifits/drawbacks of software
you've used would be greatly appreciated.

I previously posted this request to net.games, but got little response, so I am posting it here. I have been attempting to solve Adventure International's "Savage Island" adventure for some time now, but I need some pointers to complete it.

*** WARNING -- spoilers follow -- hit spacebar at your own risk ***

I have managed to weather the storm out (no pun intended :-), given salt to the bear, and collected:

```
Knife             -
Plastic Block      |
Coconut            |- How can these be used?
Bottle of Rum      |
```

Fish Bones -

Building the raft, I sailed to the atoll, met the pirate, and received a bandanna and a note. I am currently in the cave with the painting and the stalactite, but cannot get anything to happen. How can I get some light to enter the "dark openings" without breaking my neck? I assume the stalactite opens, since it is hinged at the top. How can I make this happen?

Any help will be greatly appreciated.

Would anyone out there be interested in purchasing a Hayes Micromodem II
(pulse dial only, 300 baud for Apple II, II+, IIe), used but in perfect
working order, with complete original packaging, software,
documentation, etc.? It may be old, but it's the most trouble-free
piece of hardware I've ever owned for the Apple. It's served me long
and well, and I'm only selling it because I bought a 1200 baud modem a
few months ago. Nothing at all wrong with it-- functionally perfect.
Asking price is $100 but I'm *very* flexible on that.
Send replies to ...pyuxd!romeroa.
Thanks very much...

I'm afraid that I would (in the strictest sense) call this software
piracy. Considering the case of vi, I was told that one of the main
reasons, if not the main reason, that vi is not in the public domain
is because of the pattern matching (and other) code from the original
ed source code. Considering the differences between ed and vi, and the
modifications necessary to achieve the differences, I think that ``major
modifications'' to source code does not constitute a completely new
entity. After all, even the author admits to jove_re.c being descended
from ed source code!

There is some confusion over word processing software available from Manx. What I have figured out is that there are two different Manx editors being discussed:

1. "Z," which is available for IBM and compatibles, and for Macintosh. This is already a vi-like editor, for those who use vi already and would like a familiar user interface. Users of Z who posted to the net have spoken well of it. However, it is NOT available for the Apple][family, according to Manx itself (800-221-0440).

2. "Aztec C," which is a bundle of software which compiles C programs and which is available for Apple][, includes an editor which can be made to be vi-like. However, the editor has not gotten good reviews from users on the net; respondents say the subset of commands is too small, and that it sometimes crashes for unknown reasons.

If I have overlooked or misrepresented anything here, please post. I'm still looking for a vi-like editor for Apple][+, but don't expect to find one anymore.

I bought a Sider last January; to my great disappointment, the first one arrived DOA, so I had to ship it back. The turnaround on the replacement was about two weeks.

Since then, its been wonderful, and I urge anyone with an interest to forget about that CD player, VCR, or whatever other conspicuous consumable you've been coveting and get serious about your computer. I can't believe I've lived so long without it.

The operating system software, partioning the disk into DOS, ProDOS, Pascal, and CP/M regions is generally excellent -- I've experienced no glitches attributable to its presence. (I didn't configure a usable CP/M partition so I can't vouch for it.)

The most serious drawback to the system is there is no documentation of the low-level device control; I have some non-standard operating routines (the DOS version of ORCA/M) which require custom disk drivers (the ProDOS version of ORCA works fine). Supposedly, FCP is working on a technical manual (an OK installation manual comes with the system).

The other problem, more-or-less generic to such hard disks, is there is no way to write-protect the drive while debugging to secure against wild code causing spurious writes to the drive. It doesn't seem to be as easy to turn on the drive as a disk ii (what could be), and I seem to have been lucky so far.

Now if only someone would come out with a cheap *backup* device, we'd be all set.

P. S. FCP just did a mailing to its customer list, with coupons offering a $50.00 kickback to owners who refer new business to them. Find someone who already has a Sider, and work out a deal with them!

I have no connection to FCP; just a reasonably satisfied customer.

I'm interested in finding a program to provide "typeset" and
graphics output on a PC. I'm most interested in lots of fonts and
nice output to a dot matrix printer so the MacPaint-alike drawing
programs are not what I want. Two I'm aware of are FONTRIX and
FANCY FONT [probably someone's tm]. Has anyone had any experience
with these or other similar packages? I think FONTRIX started on
the Apple II.

Please mail to me and I will post if there is sufficient interest.

Thanks,

Robert Evatt

*** REPLACE THIS LINE WITH YOUR APPLE][+ ***

When using vi, I can't get a full screen display on my][+ with Videx 80 col and Enhancer options. Initializing the 80 col. board to 24, etc. doesn't seem to have any effect. Software is AEPro and emulation is either none or option 5 which is 80 col. board. System is 4.2 on Pyramid 90x. The termcap is a straight crib from the Videx 80 col. documentation. Yes, the board works fine when used directly from BASIC.

Obviously somebody has solved this years ago. But how?

Thanks.   George Gorsline VE3FIU / K8HI

I have figured out how to use a 80 col card on Kermit, if this
has already been out please excuse me.
1. Bload kermit
2. call -151 - into monitor
3. Display $801 - this should be a jump
4. Display jump address - there should be two jsr instructions
5. Change the second jsr to "jsr cn00" - where n is slot # of 80 col card
   Now you can run the program by starting at $801 to test it
or bsave it so it will be ready to brun. Some things to look out for:
You should have the monitor reference manual avaliable, remember the
addresses are least significant then most significant order and the backspace
doesnt affect the screen alto it really has backspaced.
The bsave for 2.1a should be like this "bsave your_name,a$801,l$4e00".
Enjoy!

   We have sucessfully run this on Franklins, Apple][+ and Apple //e. Ah the
Franklin its not perfect but what a great machine!

....
    A plea for assistance...   I've been working on a program
for the Apple II that uses the 80-column card, and am having
a bad time trying to get it going on the IIe. The
program does cursor addressing by sending characters to the card
via the "Pascal entry" at location $c9aa. This works fine on
(most cards) on the II+. On the IIe, however, all sorts of
extra weird characters are produced and the addressing is not always
accurate.
    I've tried poring over the IIe 80-column card ROM listings to no avail.
    Can anybody help me? I init the card (in slot 3) by jumping
to $c300.

    ANY help would be much appreciated. Please don't hold off
responding because you think someone else will -- I don't count
on a big response.
    Is there a standard initialization entry point other than $c300
for use by pascal?
   Thanks, Greg Dudek

#
Apple //e with 80-column card
The modem interface is permitted to discard LF (maybe DC1), otherwise
passing characters to the 80-column firmware via COUT (PR#3 assumed).
Auto-wrap does not work right due to newline scrolling delay, which also
requires that you set "stty cr2".
Note: Cursor addressing is only available via the Pascal V1.1 entry,
not via the BASIC PR#3 hook. All this nonsense can be avoided only by
using a terminal emulation program instead of the built-in firmware.

From what I read on the net, I think there are some sites that are using
the Apple Laserwriter from their Unix machines, as well as via the
AppleTalk network.
What I would like to know is:

1) Am I correct in this?
2) How have you connected the Laserwriter to both AppleTalk and Unix (VAX?)
3) Do you share the Laserwriter between the two?
4) Is it true that while talking to the Laserwriter via the RS232 port you
   can only use one built in font?
5) Does somebody market an interface that connects a VAX (Unix or VMS) to
   AppleTalk, i.e. some form of H/S-DLC protocol card?
6) Anybody have specific information on the above for VAXEN running VMS?

In case of enough replies I will summarize to the net.

>   Can anybody help me? I init the card (in slot 3) by jumping
>to $c300.

The Pascal initialization entry is $C3xx, where xx is the value stored
at $C30D. On an enhanced //e the value is $4A, meaning that the initialization
entry JPINIT is located at $C34A. If you are using a different Apple II-series
machine (such as an unenhanced //e), or if you use a non-Apple 80-column card,
you will need to find the correct value for your machine.

Note that the $C300 entry does BASIC initialization, and BASIC does not
recognize cursor addressing.

For completeness, the other Pascal entry points are described as follows in
Apple's ROM listings (enhanced //e version):

```
* Pascal 1.1 Firmware Protocol table:
*
* This table identifies this as an Apple //e 80 column
* card.  It points to the four routines available to
* programs doing I/O using the Pascal 1.1 Firmware Protocol.
```

Don't know the parms for Copy][+ (a rather buggy program-try vers 5.2),
but you can use Locksmith 5.0 (any rev-A thru F) with no additional parms
and Forecast will copy just fine. Good luck!

I am trying to clean out my upstairs and I wondering if anyone is
interested in purchasing the following. All is in working condition.

Wirewrapped Apple II plus - constructed on 3.5" X 7" boards with
                  gold plated pins. All plug into a backplane
                  that has gold plated/spring loaded fingers.
                  All is enclosed in a metal chassis (with fan).

I also have the dual disk controller, RAM expansion, and Vortrax speech
synthesizer, all of which work and plug into the backplane mentioned.

I have kept the system documented, so schematics matching the hardware
exist.

A Shugart SA400 disk with very few hours is also available. It is modified
to work with the Apple disk controller.

Someone may be interested in an Apple to drive hardware hacking projects.

Make me an offer if interested.

                        Randy Banton

I have a Fourth Dimension disk drive on my Apple][+.
It READs just fine. (Well, actually the heads are getting a bit out of align,
but that's a different story...)

Anyway, I cannot WRITE to it at all.
I've tried the following:

unplugged the pairs of leads to what appears to be a LED and sensor

on opposite sides of the write-protect notch. Then:
a) left either-one/both "open"
b) left one/both "wired" (i.e., I put a short wire from one pin
   in the connector back into the other pin.)

c) shorted the "write-protect" pin (#19???) on the
   connector to the disk controller to +5.
d) various combinatons of the above.

Whew. At least I didn't destroy anything!
The result is consistent in both drives 1 and 2. ... no luck.
Meanwhile my Apple-brand disk keeps on humming, four years later.

Questions: Why didn't at least one of the above work?
What CAN I do to be able to write on it?
(and at the same time still be able to control w-protect, if possible,
even if via external, manual switch!)

And on my other problem, what luck have people had in adjusting disk drives?
Is it a procedure that a software-type (i.e., 8-of-10-thumbs around
a soldering iron) can handle? How long does it take?
I have A.P.P.L.E.'s disk-analyzer, which has zillions of warnings
and caveats. Are they over-doing it or what?
If I go to a store, how much is it likely to cost?

Thanks, world.

John Burgess

I have a friend who needs help using PIE with his NEC PC8023A-C
printer. He cannot figure out how to pass control codes to the
printer from PIE. He is a novice user and I don't really want
to learn PIE and all about a NEC to figure this out. He HAS
talked to NEC and PIE people and to the people from whom he bought
the printer, but they have not helped him. Any information about
how to modify PIE (if such is possible) for the NEC or pointers
to such information would be greatly appreciated.

Hello out there. I've decided to call upon the collective
wisdom to make suggestions regarding a purchase to be made
soon.

I want to get an apple II c, letter quality printer, color monitor,
and a word processor. I would appreciate comments regarding any of
the above (not of the variety: why not a Mac?). Any info concerning
good places to purchase the above (in the Los Angeles or Portland, OR
areas) would also help.

So far I've had recommended the Brother HR-15 LQP, and Word Juggler.
I have no intuitions concerning monitors and the like.

Please send your replies to me directly and I'll (eventually) post
a summary to the net.

Thanks very much,
                            Seth Goldman

Would you be willing to part with parts of it?

I have an Apple II+ and two disk drives and a monitor. I just recently bought an 80-column card, but it is not so good. Yours, along with some of the rest of the supplies (64K RAM card, PRO_DOS, etc.) sounds interesting.

I'd like to know if you'd be interested in selling individual supplies, and what the price(s) would be.

I wouldn't be interested in the entire package, but the synthesizer sounds fine (no pun intended). I'm not sure how much they cost (I deal mostly through mail-order companies and have not been successful in finding a good synthesizer), but if you are interested in selling it seperately, send me an offer. I'll consider it.

I have seen several ads for S.C.R.G. and their products: Switch-A-Slot, Extend-A-Slot, Paddle-Adapple, QuickLoader and 9-16 Adapter. I was interested in getting the Switch-A-Slot, a device that lets you choose between 4 cards, it's a box that sits on/under a disk drive and you just switch between each card.
My Question is: Has anyone dealt with this company before? Are they reputable?
Has anyone bought this Switch-A-Slot, and if so what are they like??
Is the Apple's Bus, u! capable of handling this?

Any comments would be appreciated as I am looking into buying one this fall, but I don't want to deal with a bad company, or get a bad product. Thanks.

Andrew Rahme.

Does anybody out on the net know anything about PROMAL?

+ What is the language like? (C, Pascal, or Action! [on Atari])
+ How fast is it?
+ Is the generated code native 65002 or pseudo-code?
+ Does it generate compact code?
+ Can you compile modules separately (ie., does it have a linker)?
+ Does it come with an usable editor?

ANY information on this language/compiler is welcome, though I am interested primarily with the Apple version.

Thanks!

Daniel Chang

<>

I am thinking about buying a modem for my Apple II plus. I have
a language card and a Videx 80 column card and would like for the
modem/software combination to use the 80 column card. I don't need
all the modem functions like auto dial and auto answer and would thus
like to save some money by buying a modem which does not have these
features. I am asking the net for some advice as to modem and
terminal software combinations that are inexpensive and as an added plus
will work with my Videx. I don't know about all the features that can
come with a modem, so if you think there are some other features that
I might not want then let me know that too.

Please help, and respond by mail. Include prices if you can.
If several people say they too would like to see the results then
I will post them for the net.

Thanks,

Mike
Davis

I have recently had the opportunity to use PROMAL, a compiler from
Systems Management Associates, on my Apple //e. What follows is not a
detailed review, but a brief summary of PROMAL's features.

First of all, PROMAL (the Apple version) will only run on an Apple //e
or Apple //c. It requires the 80 column card and extra memory. PROMAL
runs under ProDOS, but it has its own environment for editing,
compiling, and running programs. Standalone PROMAL applications to run
under ProDOS can be developed, however. This requires the developers
version of the system, and costs a bit more.

PROMAL compiles down to an intermediate code which is interpreted at
runtime. The executive is quite fast, however, and PROMAL programs
consistantly run faster than Apple (UCSD) Pascal, which is also
interpreted. In the benchmarks I've run, only Aztec C runs faster than
PROMAL (3-5 times faster, but that's native code). Turbo Pascal is
also faster, but that's not a fair comparison since Turbo runs on a
Z-80 under CP/M. At any rate, PROMAL beats the heck out of BASIC, even
compiled basic.

The PROMAL editor is pretty good. It is a screen oriented editor which
is basically modeless, and has most of the usual text editor features
as well as handy programming features (auto-indent, etc). Function

keys are implemented by using the open-apple key and any number (0-9). Each function key may also be reasssigned.

The compiler is fast and generates small code. It can compile from memory, so you can leave the editor and compile without any disk activity. PROMAL uses the 64K extension as a "workspace" similar to a ramdisk. Include files and chaining are supported, but not separate compilation. There is no linker or assembler.

PROMAL looks like a cross between C and Pascal. It has byte, integer, word (unsigned int), and real data types. It has arrays, but no structures or unions (records or sets for Pascal fans). It has all the major constructs such as for, while, repeat, case. It supports strings a la C (null terminated) and, like C, depends on an I/O library for many functions. Formatted i/o is very similar to the C implementation.

The programming environment is sort of like a shell, and supports I/O redirection and a history feature with command line editing. As in the editor, function keys are implemented.

All in all, it's pretty good. It's easy to use, easy to learn, and doesn't take half an hour to compile like some other compilers.

I'll be glad to answer any other questions by mail. Hope this was of some help to someone.

I am working with a non-profit group that is running a large convention. We would like to set up a database to help us with our scheduling. We have access to an Apple III+ with 256K memory, 2 floppy drives, and a serial printer. Also, we have Apple Pascal available.

Ideally, we would like to be able to set up entry forms for the records, do retrievals with multiple constraints, sort lists of records, and all the other neat things a DBMS should do. It would also be nice to be able to write Pascal programs to interact with the database as well. Also, programs for doing scheduling problems would be of interest to us.

We would greatly appreciate any info/advice that folks might have for us. Please reply to me by mail. If anyone is interested in what we find out, drop me a line and I'll send you a summary. Thanks in advance for your help.

After _FINALLY_ getting my termcap working for my Ultraterm display

card, I thought I would pass this along to anyone that might have a use
for it. [I don't make COMPLETE guarantees, but it works for me!]

The visible bell option works especially nice.

My system [for reference] : Apple][+, 64K, Ultraterm display card,
                  Apple Cat][212 modem, + more all
                  controlled by ASCII Express: Pro.

[BTW: If anyone has questions or problems with the Apple Cat, or AE: Pro,
 I might be able to help. Just mail!]

I bought the Extend-a-slot from SCRG. When I tried it with a PCPI Applicard and tried to boot CP/M it did not work. I then tried it with a Videx Ultra-term and got occasional bad stuff on the screen. I called SCRG and spoke to one of the most reasonable and helpful people I've ever dealt with at a company. He explained that the Extend-a-slot is not recommended for coprocessor cards and some others add-ons. I have not tried it with any other cards, and obviously its length creates too much noise for some card functions. But just on the quality of the response I got (he said I could return it for a complete refund if I wanted), I highly recommend the company. I don't know how long the Apple bus can be extended from a slot, but I see no reason not to try any of their other products. You may be limited as to what cards you can use though.

We just received a shipment of what is billed as a "power" users spreadsheet for the Macintosh entitled CRUNCH. It looks a great deal like 1-2-3 with a number of intelligent enhancements.

1 - Memory management is sophisticated ala the SMART spreadsheet. (i.e. unused cells are not allocated)

2 - Built-in spreadsheet auditing

3 - Graphics are available from the same menu (and disk) as CRUNCH.

But...

While playing with the REPLICATE function a rather nasty "feature" was discovered. If you should exceed memory by say attempting to replicate a formula or value the length of an entire column (9K plus cells) you run out of memory at approximately 5600+ cells. The application dutifully notifies you of this fact. If you then erase the cells in that column and now try to enter data anywhere else on the spreadsheet it will not allow such a move.

The reason is that the application is still certain that you are out of memory. Some flag has not been reset! Thus you are suddenly unable to do anything else and the supposedly unused cells still be considered in the memory management allocation schema.

Other than this the documentation and appearance are clean. I trust that the bug will be cleaned up in the next release. Rumor has it that Paladin was bought out by Lotus. Or am I confusing them with Palantir, or simply mistaken altogether?

Keywords: Apple Pascal 1.2

Hi there,

I am looking for a terminal emulation program running on Apple Pascal 1.2, using the cursor addressing and other features of the 80-column card. It is supposed to send it's I/O to the slots REMIN: and REMOUT:, and it's preferable to have some features for file transferring, as well as some buffering capacities. Does somebody have such a program, including a useful termcap entry? My splashing gratitude if you could send it to me (below).

Thanks in advance,

We have a large number of programs written in Apple BASIC that we would like to convert to run under GW-BASIC on a Zenith 150. Does anyone in netland know of a book or program to facilitate this conversion process? Anything to facilitate conversion from Apple II BASIC to IBM BASIC would help. (Even useful article references in the micro journals would be of use.)

Reply either directly to me or to the net.

*** REPLACE THIS LINE WITH YOUR RUMOUR ***

Paladin/VisiCorp is across the street from us. Paladin, who was developing some sort of an AI based integrated thingy, was formed by some ex Visi people. After remerging with Visicorp (after a bloodbath at Visi), the newly formed Paladin/VisiCorp decided that they really wanted to stay in software publishing. They layed off most of their technical people (some of whom were QAing CRUNCH as their final assignment). Now, cars are seldom seen in their parking lot past 6:00pm. Also, CRUNCH wasn't developed in-house.

An apocryphal story about the old Visicorp told that the only manager in-house who actually *used* any of their products was Mitch Kapor.

I know of someone who is trying to dial up to the 3B2/300 where I work using an Apple III. I believe his software is called MicroTerm, and it is supposed to emulate a vt100, but isn't working. Does anyone know of a tried and true Apple III termcap, or a way that we could get this to work? Please send all replies by mail. Many thanks in advance.

I'm looking for information about a piece of software called Gutenberg for the Apple II series of computers. I've seen it work, so I know it's more or less the package I want, but I need a couple of questions answered, namely:

1) What company made it?
2) Is it still being published?
3) Does it support the Okidata 92 now? (Past versions didn't.)
4) Where can I find it?
5) How much do people want for it now?
6) How was support for the product?

Anyone who can tell me anything in these areas or relay other useful

information about Gutenberg can send me mail at ...!pyuxww!pyuxt!romeroa.
Thanxalot...
         -Antonio Romero

This just in from the Info-Apple ARPA mailing list -- thought I
should spread the word.

From: Glen Daniels <MLY.G.DANIELS%MIT-OZ@MIT-MC>
Subject: Re: EMACS and Apple][e

[...]

I think you people may indeed be interested in the following ad
I picked up at Tech Square the other day...

EMACS & Apples?

 Yes, it's true! Now the famous display editor that was once available only
on mainframes can run on your Apple //e or //c computer.

AMACS is THE definitive editor for the Apple.

If you own an Apple, then you know that there is a dearth of competent text
editors available for your machine. The writing of AMACS was prompted by this
state, and now this state no longer exists.

Features:

Keyboard Macros	Winchester disk compatibility
LispM style matching parenthesis	Multiple buffers
M-X completing reader	Numeric and string arguments
Two Window Mode	Ultra-fast booting
Comprehensive manual	Auto fill and Atom word minor modes

Lisp, Merlin, C, Pascal, Text, and Fundamental modes

User-definable ergonomics, from M-X set key to blinker speed

AMACS's Merlin Mode is perfect for editing assembler code, with special commands for that assembler's style. In fact, AMACS was incestuously written using AMACS's own Merlin Mode. Source code is available as an option, and can be assembled, and linked with the Merlin assembler.

Introductory pricing: $75.00 Program Only; $350.00 Program & Source
$15.00 Demo Disk & Manual; (saving disabled, refundable)

Is it possible once inside the Apple monitor to have listings of assembler code dumped onto the drive rather than the printer? I want to hopefully upload the assembler code to another machine for other uses.

I need some information {help}.

I have been investigating Applesoft Basic Compilers, for the "new"
Apple //e. There is precious little information published about
compilers for Apple. The Apple Software Annual had a chapter, but it
is very outdated, seemingly based in information at least four years old.
This information is the same as that in an old issue of Softalk
magazine. One test was published in the Feb, '83 issue of Computer
Applications in the Laboratory, for the Apple][+.

The four compilers mentioned are:
     1)Microsoft Applesoft Compiler (TASC)
     2)Einstein Expediter (misnamed.. was the old On-Line Expediter
     ][, later revised and published by the Einstein Corp as the
     Einstein Compiler)
     3)Hayden Compiler +
     4)S.W. Data Systems - Speedstar.

The Einstein Compiler was taken off the market several years ago,
due to too much demand for support of a relatively low-cost, low-profit product.

The Hayden Compiler + was taken off the market recently; apparently it
didn't work reliably with the Aple //c and //e.

I have been unable to find the Speedstar.

Microsoft is making their compiler, which is said to work with the //c
and "old" //e, and should work with the "new" //e. However, based on
the "benchmark" tests done in the publications, the speed increase is
only about 3-5 times, maximum, with a 1.5x expansion in size.

BASED ON THIS HISTORY, I would like to know is there are other

compatible Applesoft Compilers out there? Does anyone have experience
with the Microsoft Compiler?

(some people have recommended the Aztec-C compiler, but I would rather
program and debug first in an interpreted language)

Please send me mail, or post to this newsgroup--THANKS!!

My version of Ascii Express emulates :

a. Nothing (default)
b. ADM3a
c. VT52
d. Hazeltine
e. Soroc

and a few others. You have to set the terminal parameters for it to work.

In the July 25 Wall Street Journal, Apple prez John Sculley met
with stock analysts to lower their expectations, saying
that Christmas sales aren't going to be so hot so they're sitting
on costs and keeping down inventory. It goes on to say:

> In comments after the meeting, Mr. Sculley described Apple's recent reogani-zation as painful but necessary. Chairman and co-founder Steven P. Jobs was re-moved from day-to-day operating responsi-bilities in the restructuring about seven weeks ago.
>
> "I didn't come to Apple with the inten-tion of taking Apple away from Steve Jobs," Mr. Sculley said. "(But) it became increasing clear that Steve and I had two very different ideas on how the company

ought to be run."
   He said, "The outcome is very clear.
There is no role for Steve Jobs in the run-
ning of this company, either today or in the
future . . . (but) there is a role for Steve
Jobs as chairman of the board."
   Mr. Jobs didn't attend the meeting. ....

Hi All,

Well I've heard that it supposed to emulate a VT52. I've never been able to
see this done at any of the Dealers I went to. They've even called up the
the HOTLINE and with there help it didn't work!!

I finally went and bought Softerm II and am using it no. It works great!!!
It emulates a VT102 and will also do a VT200 series soon. I strongly recco-
mend it....

Later

Joe Craparotta [NY1MM]

the above are personal opinions and not that of Digital Equipment!!!

Ascii express will emulate any of a number of terminals--there are
around 10 canned emulations-- or you can set appropriate parameters.
You have to remember that internally the software emulates a terminal
of some strange variety & a translation must be done to have it
appear as a vt52 to the outside world. On the incoming &
outgoing terminal selections, I believe the correct choices are 6 & 5.

Could anyone tell me how to do the shift-key modification on the Apple][+?
I need it to use it with wordprocessors, etc.
I have taken the computer apart before, but I am still not an expert.
Please be as clear as possible!

    Thanks!
    Chester

I've written a program in C that converts Epson MX-80 control codes to the
equivalent PostScript necessary for the Apple LaserWriter to emulate an
Epson MX-80. (Don't laugh --- you can't configure a lot of existing programs
to produce PostScript.)

Does anyone on the net have suggestions for companies that might be interested in buying such a program? Preferably, all rights to it --- I can't be bothered trying to advertise it and deal with customers.

Summary: It can be done, but...

In article <2233@utcsstat.UUCP> anthony@utcsstat.UUCP (Anthony Ayiomamitis) writes:
>
>   Is it possible once inside the Apple monitor to have listings of
>assembler code dumped onto the drive rather than the printer? I want to
>hopefully upload the assembler code to another machine for other uses.
>
There is a problem doing this, because the monitor does not expect the output routine (in CSWL) to destroy the X or Y registers, but the disk handler does destroy these registers. The problem manifests itself by about one line in 10 being broken, which is about the frequency at which it is actually doing disk block IO.

I do have an amazing basic program. You tell it what range of memory you are interested in, and it writes a data file with the disassembled program from that range of memory. I used it to freak the disk IO routines in DOS, so there was never a problem of memory usage collisions with the basic program itself. It calls the disassembler in the monitor as a subroutine, once for each line. CSWL has been replaced by a routine that just stores the chars in the buffer at 200. After decoding each line, the program writes the buffer at 200 to the file. Since the actual write call is from the basic program, blowing away the X register doesn't hurt anything.

Write me if you are interested in a copy of the program.

WOW!

I don't know about most of you, but I program computers for a living. And after spending 8-10 hours in front of a CRT about the last thing you might imagine I'd want to do is sit for another 2-3 more at HOME! But the fact is I do and enjoy it. The Macintosh is simply a joy to work on.

Aside from the many programs I own that serve a purely functional purpose I have three which are simply diversions. I have Sargon III, MusicWorks and Videoworks. All three are from Hayden; well-done and relatively in-expensive as far as I am concerned. This Saturday I found another music program. I thought long and hard about buying another...but...this one is superb!

I take nothing away from MusicWorks, but ConcertWare + has simply got the others beat in the SOUND department. Without waxing (or perhaps only trying to) eloquent about the many features in the program, let me simply suggest that you go and hear it for yourself. If you like it fine. Maybe like me you'll buy it. If not then consider me as a person with a tin ear and let it go at that. But I think you'll be very pleasantly surprised.

<<< included for historical reasons >>>

What is the {best, easiest, cheapest} way of upgrading the disk storage on a IIe to over a Megabyte?

I don't feel like adding a string a 10 Apple disk drives with 5 controllers to do this!

Can you recommend:

a- Any other 5 1/4" drives for the IIe, preferably with close to 0.5M storage/drive?
b- Any 8" drives with more than 0.5M storage/drive?
c- A 5MB or 10MB Hard Disk?

that works without any problem under DOS, ProDOS and a Microsoft Z-80 SoftCard?

Have you used any of the above? What were your experiences?

10MB HDs for the (yeech!) IBM PC seem to be going for less than $600.00 these days. Is there anything even half as good for a IIe?

Thanks,

Luis Jenkins

. . .
. . .
I desperately needed the extra slot so I had to upgrade.
Their present policy is, if you use a charge card, they
will clear it for $100 but will hold it for 30 days until they
get the keypad expander circuit board; after they receive the
expander, they will only charge $50.00.

The new //c version has a one page insert on the
differences between the two versions. One difference is a larger
capture buffer so it doesn't have to save to disk as often as the
64K version (this may be critical if you are talking to an IBM
system or any half duplex system that doesn't know what control S
is for). The other difference is that it no longer takes up a
slot and is very handy for //e or //c users because it uses the
open and closed Apple keys (I had hooked up the open and closed
Apple keys on the 64K version).

I like their product but I think charging for the upgrade is

unreasonable because of their advertized upgrade policy.
NOTE: They are working on a PRO DOS version which may be done by
Xmas so you may want to wait until then.

ihnp4!ihlpm!lyourk   Loran N. Yourk
                        AT&T Technologies

NOTE: Insert trademarks where they are needed.

Disclaimer: I have no connection with Softronics other than that I
use their product (because nothing else comes close to what I
need, unfortionally) and will only benefit from this if
Softronics gives me my $50.00 back (or if any of you in netland
want to give me the other $50.00 that you would have spent on the
upgrade - which is to say for either of the above, FAT CHANCE!).

Those are the parameters I recall also. I don't know if it makes a difference
with different boards; mine uses the Apple Super Serial Card.

I hate them. First I buy the original Softerm. One of the main
reasons is that their ads promise *free* updates for the life of the
program. Then they come up with Softerm I and II. It corrects most
the bugs in the original program, plus adds xmodem support. So I call
the update number expecting to receive the updates. No way. They are
going back on their promise of perpetual support for Softerm, I must
send them $100 to get the updated package. And now I hear that I must
once again shell out $100 to keep my version current? Arggggggh!!!
Someone should sue these folks for false advertising.

Another problem. At work we have a few dozen AT&T 6300 PCs that we
would like to connect to our mainframe. Since we need Televideo 950
support (complete with protected fields) Softerm PC sounds like a
natural. Can you believe that these folks have no educational
discount and no quantity discount? If we want Softerm PC for 30

machines, it will cost 30*195= $5850!! The only other alternative
would be to buy a site licence, but that would cost more than buying
30 individual copies.

Before becoming a computer jock I was a professional musician. I tried
MusicWorks, ConcertWare+, and Professional Composer before buying
ConcertWare+. ConcertWare+ is superior to MusicWorks in a number of ways
besides sound, pieces can be longer, meter and key can change in the middle
of a piece, many more meters are available, etc. Professional Composer is
the most powerful system but it costs $500 and is in some ways inferior to
ConcertWare+, particularly in user interaction.

HOWEVER. None of these programs is really useful to a professional jazz or
pop musician. You can't add chord changes, the sound should be a midi interface

to a real instrument not these silly computer synthesizers that sound like a joke, ... I could go on for a while.

Bottom line: I bought ConcertWare+ but it's for sale now.

We have for sale some unopened, untouched year old apple
][e peripherals.

quant.	item
3	apple II disk drives without controller
2	asynchrous serial ports
1	fortran card
1	pascal card

Make me an offer. We need to sell this stuff, as we are not buying the computer to use it.

Thanks GINO

     How about RANA Elite III drives? While they are a little expensive,
     they hold ~800K (if memory serves).

>   b- Any 8" drives with more than 0.5M storage/drive?
>   c- A 5MB or 10MB Hard Disk?

     I've been seriously looking at the Sider 10MB hard drive. I
     can't remember the company offhand, but check some recent
     issues of Byte. I've heard good things both from the net and
     from users I know.

[]
Anyone use Homeword with their Apple][+? I would like
to know how to get Homeword to print brackets [], tilde ~, and stuff
like that without having to use ctrl-X and the ascii code. When I
do that, it messes up my formatting on the typing area because it
looks something like this:
Apple
Ascii Code 96
Ascii Code 98
+
just to print Apple][+
Any help will be appreciated!

-Chester-

    mit-eddie!cht

p.s. A glossary function like Apple writer II would be very convenient.
p.p.s. Oh I wish I have an IIe instead!!!!! LIfe would be easier!!!!!!

I can't comment on the contents of the bulletin board that you quote, but I
was an owner of Softerm-2 and was provided a Softerm-2c package (complete)
for $50, the title page of the old manual, the keypad expander card, and the
program diskettes. The new package is great on my Apple //e (enhanced) --
almost the same as the previous package, and the almost difference is not
essential, just cosmetic. I wouldn't EXPECT a company to upgrade for less
than the full price, so am pleased with the Softronics policy even if it were
to cost $100. There are several companies that I've come across that charge
full price for an upgrade.

I am currently using Lisa 3.1 under ProDos. I would like to know
what other assemblers are available for ProDos, and how you would rate

them. Are there any "features" which get in the way of porting code
written with one from being adapted to another? Specifically, can source
code be read/written as a vannilla text file?

Please mail directly to me, and I will summarize the responses.

I would say to talk with Andy Shore at Adobe, 1870 Embarcadero Suite 100
Palo Alto, CA 94303 (415) 852-0271. Their TranScript does such for
ditroff, C/A/T troff, and such already. It tends to make PostScript

nearly universally useful, which pleases me.

I would not recommend the RANA as Infoworld reported that RANA has gone out of business. It is also rumored that Apple will be introducing a 800K 3 1/2" drive for the][in January.

I've heard mostly good things about the Sider. One thing you should note is that it might not work for CP/M if you have a 64K CP/M card. You might need a special driver which they probably haven't written yet. Anyone else have information on which CP/M cards the Sider will work on?--

Does anyone know how the extra memory on the AE Ramworks card is
accessed? It is rumored that Apple's yet-to-be-announced 1 megabyte
ram card for the //e will follow this method.

I need to buy a modem and found that I can get a good deal on
an Apple Modem 1200. However, I know nothing about this device.
I'd appreciate any information concerning technical specs for this
modem, as well as answers to:

1. What degree of Hayes compatibility does it have?
2. How reliable is it?

Thanks in advance!

Before investing in Rana drives you should be aware that Rana has gone out
of business. Their drives are still available, probably at good prices,
and they ARE well made, but don't expect any support. Elite III capacity
is about 650K. I have one I bought over a year ago and it works fine.

I am having some problems with AE emulating various terminals. I can get
Ascii Express to use macros (dial and soforth), and I turn the emulation
'on', but the stupid progam still doesn't emulate that terminal. Any ideas
on how to FORCE AE into emulating a certain terminal, or better yet,
how to get AE to emulate a terminal without using those pesky macros?
I am getting desperate. I can't use ed from home forever!

>   Thanx in advance.

In the ASCII express program menu select option U then option S to set
 terminal type -input mode- Datamedia
          -output mode- vt52
I believe the settings are 5 and 6.

After exiting from the terminal setup mode you can write the macro
out to disk (see menu). You can also modify your macro.lib to include
the vt52 macro and select it from the macro list (Select A Z / ?).

When you sign-on to UNIX type the following:

```
setenv TERM vt52
```

This should allow you to emulate a vt52

Summary: Basic program and instructions

Sorry about the delay, took a few days to locate a good Kermit to get it transfered up. BTW I used the SERDAC version of the MACC implementation.

Run the program, give it the start and end addresses (IN HEX!!!) of the range you want to disassemble, and a file name to which it will write a data file containing the disassembled code. It uses a short patch at $300, so it will not disassemble code at $300 without modification. The patch is position-independant, so you could relocate it to $8000 or something if you need to disassemble code at $300.

As stated before, I used it to freak code from DOS, so the address problems never came up.

This could probably be done much simpler by planting a CSWL hook that just saves and restores X and Y, but I didn't think about that until after I had written the program.

I apologize to C and every other systems implementation language I have ever cursed. Systems programming in Applesoft Basic is really like pulling teeth!

Summary:

*
     Software to read Apple disks on IBM PCs does not exist, since Apple does not use the index hole (I agree that this is a real drag). Special hardware is therefore required. There is a board by Quadram which lets you run Apple software in the PC and I think lets you read Apple disks on the PC. I think the board is the Quadlink. Also, there is a board called Apple Turnover by Vertex I believe, which lets you read Apple disks on the PC. These are the only 2 I know of. If any software alone does exist, I would sure like to know about it also, since I have a Basis 108 (Apple compat) at home, and an ATT 6300 at work.

Summary:

*
     Regarding setting the environment of the unix host while AE is emulating a vt52, you may have to do more than setenv TERM vt52. This sets the term but when you printenv, the termcap is still the .login device values. To change the termcap envir. values if you are running csh, do a

     set noglob; eval `tset -sQm :vt52 `; unset noglob

Notice the backward apostrophes. This should change the termcap values. I just went through this myself, except in cp/m using modem7. Unfortunately, the Apple end still doesn't work properly even though the control characters are correct. For instance, to clear the screen an ESC * sequence is used in Apple cp/m (at least for the microsoft version). When I do a more something, the asterisk gets printed on the screen instead of being a control char. It's like the ESC is getting stripped or something. Anyone have any ideas. I have ascii express and I'll try it but I would prefer to do it all under cp/m.

I am working on contract for a gentleman who has left me with an Apple //e,
a Gemini 10x, the two being connected via a Wizard printer card. Alas, he
left no manual for the Wizard card, and I am left to work by trial and error.
What I am having problems with is getting the card to receive and send 8-bit
data. I have been told that it is "intelligent" enough to do this, but am
unaware of the control sequence to trigger this process. Can anyone pass it
along ?

Thanks - Peter Rukavina (@traill)

I think there was some discussion on the net recently about a new
release of Softerm II. Could someone give me specific revision numbers?
I'm thinking about buying this hw/sw package from a discount house that
sells it for $125. But I'm a little concerned because Softronix still
sells it for $195. What aren't I getting?

Does anyone know of a kermit program for the apple II+.
If so could they please post it in net.sources.apple.
If one doesn't exist please post that info also.

thanks much

From: molbio (Mike Cherry)

I'm having trouble using kermit-65 on my apple IIe. It seems that kermit
in vt52 mode (or is it the apple?) is treating a <CNTL>-M as a carriage
return, as well as, a new line. I can use vi to edit a file with lines
longer than 40 characters because a blank line is placed between the 40
and 41 characters.

Anybody seen this before? Any suggestions?

Mike Cherry

300 baud applecat modem ($50) (com-ware II software)
Two Lobo Floppy Disk Drives ($200 each)?
Apple II+ ($400)?

The prices listed are what I consider mininal. If I get more than one request for a package, I'll take the higher offer. I'll wait 10 days and then mail replies to everyone that responded. I don't want to go through all the shipping headaches, so please let me know how you would like things shipped (you pay). For now mail me your requests and questions.
No orders less than twenty dollars please.

For Sale:
Hardware: Apple II+ computer (64K), shift-key modified (switchable)
          Disk controller and 2 drives (1 Apple drive and 1 Rana drive)
          Apple Super Serial card
          PKASO printer interface with ROM drivers for screen dump and more
          Hayes Joystick

Software: Aztec C compiler by Manx Software, FULL K&R (including stdio
            library) except bitfields, compiles to 6502 machine code,
            has a mini-shell, includes source for a vi-like editor,
            complete documentation, sells new for $200
          Choplifter, Pinball Construction Set, Micro-chess, other misc.

You can have it all for $550.

HI,
     Just want to report that the SOFTERM package has a problem
with an enhanced //e (mine). It uses the *wrong* character set for
most of its menue headers so you get the form and icon character
set.

     Hope their new version ($50 if you turn in the original) is

ready for the enhanced //e and ProDos on a hard disk.

    It is a complete terminal program with too many options to remember so you got to have the menus.

    I notice one other little item. When the cursor is on an UC character it turns the character into something else instead of just reverse video.

    I have sent for the new brochure and will report on what it says and any answer I get when I call to complain about this versions problems.

Shafted!! There is no reason that I know of to pay full list price for any product unless you feel that you need to subsidize the company that makes it.

As for Softerm, they charge about $100.00 to retailers so their price is a bit out of line. If you need, want, and/or can use the latest version, you have to have a 128k Apple //e or //c and ask for the //c version.

I have an Apple II and I am having trouble finding a good terminal
program that will work in conjunction with UN*X. Does any one know of
a terminal program that will allow the use of the <curses.h> library?

Please reply by Mail
Thanks in advance...

>   ***

Yes, the Apple doesn't use the index hole (that's why you can flip
floppies without cutting out a new index hole). Still this is a
problem one could work around.

But the differences go much deeper than that. Apple uses special
hardware (the infamous Woz machine) and software to read/write the
disk (See "Beneath Apple DOS" for a great explanation). IBM-PC on
the other hand uses a "standard" disk controller chip (NEC uPD 765)
which has the formats built-in (no whizzy software).

Although nothing matches at any level (directories, track/sector
markings, etc.), the bottom line is that these could all be worked
around except for one especially subtle gremlin:

The way in which the data and clock is mixed onto the disk is completely
different. The PC uses standard MFM, the Apple uses no clocks but
restricts the data to certain patterns.

There is a new video driver that works with the enhanced //e
that doesn't use any of the mouse text characters on older
versions of Softerm. Call the online update service and download
it.

As far as the ProDos & hard disk version don't hold your breath.
It probably will be released after a couple of months (I am
hopping it will be ready by Xmas).

I recently purchased a copy of Applewriter. This had been a store demonstrator copy, and somewhere along the line the manual was lost. Due to the help facilitys available I have figured out Most of how to use the program except for one very important thing -- I can't get it to work correctly with my C. Itoh 1550 printer.

Is there a way to configure the program for a certain printer? If so would someone out there please tell me what it is?

Thanks,

Sean.

Summary: Need Apple][+ motherboard

Hello,

Does anyone out there in net.micro.apple have an Apple][+ motherboard that they would be willing to sell to me? I have a kit-built Apple with TI sockets (* AGGGGHHHH! *), and I would like to try new sockets so my memory access will be consistent (one gets tired of having Flight Simulator ignore keys, freeze up, or Pac-man ghosts become even more ephemeral as Pac-man vanishes into the (void)...)

The following is a solicitation for help to complete, and a proposal and outline for, a Berkeley style shell to run under Apple's ProDos operating system on the Apple II series computers. I am submitting it to net.micro.apple because a {net,mod}.projects does not yet exist.

Please respond by uucp or U.S. mail to:

Bryan Costales
212 Prentiss
San Francisco, Ca 94110

uucp: ...!ptsfa!eeg!bcx

Colaborators Sought

1. Background

When I first received the ProDos operating system, I marveled at how close it came to bringing the Apple into the world of Unix. It didn't take long, however, for me to discover its drawbacks. The following are observations, not flames.

- -- The shell that is supplied by Apple (BASIC.SYSTEM) is, like the former DOS 3.3, merely intended as an extension of Applesoft BASIC and not a true shell.

- -- The kernel (aka MLI) contains some wierd restrictions. File names MUST be upper case and may only contain a "." (shades of cp/m). Directory files may be read but not written to, except as raw blocks at the lowest MLI level.

- -- None of the "mode" bits are allocated for "permission to execute". None of the "reserved" bits are available to programmers.

So I waited. Eventually a few shells arrived that attempted to make ProDos a little more 'Programmer Friendly'. First came the Orca/m assembler. Better, but not a true, general purpose shell. (eg. Command line arguments resemble RSX). Then came the Anix 2.0 shell. Even better, but still short of the mark. (eg. redirection supported, but buggy on hard disks). Finally, I'm stil waiting for the Aztec C shell (Late August is their latest promise).

Despite these drawbacks, I still feel ProDos has the potential of making the Apple environment more Unix-like.

2. What I Have Done

Shortly after ProDos was released (I was working with pre-release documents), I began writing my own shell. Because there were no assemblers running under ProDos, I used Lisa 2.6, under DOS 3.3, to write it. The moving back and forth between the two systems killed me, and I abandoned the project.

I then purchased Orca/m ProDos Version and started anew. I quickly found that I couldn't addapt any of what I had done under Lisa 2.6 to Orca. I also discovered that Orca/m is about a 100 times slower than Lisa at assembling. So stopped again.

My latest shot began when I purchased Lisa 3.1. This assembler is a quantum leap above the old Lisa. Unfortunately the parsing rules and some syntax was changed in the revision and I decided to rethink the project and start over from scratch.

3. Why I Seek Help

I now have 2000 lines of code and am only 1/4 done. What with work and other commitments, it will be a year or so before my shell is completed. Since it was my intent to place the shell into public domain, I thought "why not see if there is anyone who would like to help?". Hence this note.

I appeal to you -- any 6502 assembly language hacks interested in joining me on this project. I am willing to, once again, start from scratch if need be. You suggest the assembler.

The Project

1. Introduction.

The name is tentatively "bsh" for "Berkeley-style Shell". Bsh is a system program (SYS) to replace BASIC.SYSTEM as the defacto shell under Apple ProDos. It is not an interactive shell, rather it is a sophisticated executer of programs.

2. Programs.

There are several types of programs that bsh can executed directly or indirectly:

BIN -- Executable binary or machine language programs. These are run in core and may overlay but not be co-resident.

CMD -- Relocatable, executable binary or machine

```
            language programs limited to one block (512
            bytes) in size. These are the individual
            commands (eg, rm, cp, du, etc.). They load
            into one of three shell buffers and must be
            re-executable without reloading.

      TXT   -- Shell scripts. Must begin with a # character.
            Environmental variables are manipulated using
            appropriate CMD's (eg. set, if, endif, etc.).

      BAS   -- Applesoft Basic programs are run by first
            loading the BASIC.SYSTEM shell, then running
            it with the file name as its argument.

      SYS   -- A shell soft exit is done. Enviornmental
            variables and history are saved. Then the
            system program overlays the shell.
```

3. The Command Line.

Programs are run and CMD's executed by typing their name followed by a space delimited list of arguments. For programs that are able to use them, those arguments are placed into and array, and the variables argc and argv passed. Certain characters have special meaning in a command line, unless escaped by a backslash character.

```
   ;     -- Compounds commands, as:    ls ; echo done
   |     -- Creates pipes, as:         ls | wc -w
   >     -- Redirect stdout, as:       ls > junk
   >>    -- Redirect & append stdout:  cat letter >> mbox
   <     -- Redirect stdin, as:        wc < mbox
   <<    -- Set EOF string, as:        cat << @FUZZY@
   >&    -- Redirects stderr, as;      prog >& log
   >>&   -- Redirects & append stderr: prog >>& log.sum
```

Command lines are also subject to wildcard expansion.

```
    *c    -- Match zero or more up to c
    ?     -- Match a single character
 [range]  -- Match any in the Ascii range, as: [0-9]
[select]  -- Match any of list, as: [A,a]
 [both]   -- Match any of list or range, as: [0-9,A,a]
```

Commands are placed in a history buffer for later re-execution. The command line is subject to history substitution.

```
    !     -- Replace with current history number
    !nn   -- Re-execute command line number nn
    !text -- Match text in history and re-execute
    !$    -- Replace with last arg previous command
    !!    -- Re-execute previous command
```

Environmental variables can be placed into the command line. The form is:

```
      $name as: cp a.out $CMD/awk
```

and they are set using the "setenv" CMD as:

```
         set CMD= /profile/shell/cmd
```

There are a limited number of environmental variables. They are:

```
    HOME     -- Home directory
    CMD      -- Command directory
    SYS      -- System programs directory
    PATH     -- Execution search path
    i        -- Numeric int
    j        -- Numeric int
    x        -- Numeric float
    y        -- Numeric float
    PROMPT   -- Prompt string
    MAIL     -- Mail spool directory
    TMP      -- Temporary Directory
    1 thru 9 -- Shell script arguments (strings)
    DEV      -- Device driver directory
    TERM     -- Pathname of driver for terminal i/o
    ROOT     -- Volume under which all other volumes
                will be files.
```

The shell also provides some built-in aliases:

```
    /dev/...    ->   $DEV/...
    .           ->   current prefix
    ..          ->   previous prefix
    ~           ->   $HOME
    #nn         ->   $DEV/slot.nn
```

Command line arguments enclosed in full quotes are insulated from all substitutions, expansions and transformations, except for substitution of environmental variables and aliases.

Command line arguments enclosed in half quotes are insulated from all change.

Command line arguments enclosed in reverse-half-quotes cause the command so enclose to be executed and its output inserted at that place in the command line.

4. Memory Use.

The shell resides at the top of memory from $a000 to $beff. Page $be00 is the shell global variable variable page. All buffers are internal to the shell except the following which build down from $9fff: The three 1024 byte file buffers; The hash table derived

from $PATH; Shell script argv strings; Command line argv strings.

Zero page is only used while the shell is "active" (it is passive when programs are running). Those locations are bank-switched in and out of an internal buffer depending on the shell's status, thus freeing zero page for use by all programs.

The shell makes no use of extended memory. It assumes a 64k Apple II+ as its basic machine. On a IIe or //c, it can be configured to soft exit to /ram for improved efficiency.

5. Hardware.

The shell is hardware independant, but is virtually unusable without:

80 col hardware
upper/lower case keyboard (or enhancer)
hard disk (profile or sider)

6. Accounts and Users.

The shell can be configured differently for different users. This is done by using the getslot program (like getty). I connects to a slot of I/O and handles logins and passwords. The location of the passwd file is known to getslot, not to the shell. The getslot program loads the shell, configures it according to the passwd file, then soft enters the shell. A soft entered shell will exit by rerunning the program that started it.

This feature is intended to, for example, allow the user to log in to his computer from work and transfer files. Give friends, co-authors, and the like, accounts on his machine for exchanging data. The password file will enable getslot to spawn, for example, a uucico type program for network mail.

7. Patches to ProDos.

To achieve a friendlier environment, it will be necessary to make some small patches to the ProDos kernel. These should be made by a seperate "patchpro" program, so that various versions of the kernel can be properly handled.

File names: A patch to allow file names to contain upper and lower case letter, and all characters.

Mode Bits: A patch to allow the reserved bits to be accessed and used by users.

Unix is a Trademark of AT&T
RSX is a Trademeark of Digital Equipment Corp.
Apple, Apple II, II+, //c , and ProDos are Trademarks of Apple Computer Corp.

Orca/m is a Trademark of The Byte Works, Inc.

Has anyone had any experience with the GORILLA BANANA PRINTER? DAK has them
on sale for $89.90 (+ $69 for an Atari interface + $7 for a graphics driver
program on disk).This price seems too low to be trusted. Does the thing
work???

I have a Microsoft 80-column card which is giving me some trouble when running Ascii Express. According the manual for the latter, ESC K (something K at least) allows one to enter a capital letter. However, mine stays in CAPS mode and I cannot get back to lower case mode. Is my problem with the 80-column card or configuration of AE?
Any suggestions/advice would be much appreciated.

****

Two complete Apple //e systems for sale.

SYSTEM 1)

Apple //e
Apple Monitor II
standard 80-column card

128K RAM-card
2 external Apple disk drives
Microtek parallel printer card
Daisy-wheel letter quality printer by Teletex
over a dozen manuals and books
various Apple utility disks
Aztec C programming language and documentation
Applewriter II software

SYSTEM 2)

Apple //e
BMC monochrome monitor
extended 80-column card (extra 64K)
2 external Apple disk drives
smart parallel printer card
Gemini 10X dot matrix printer with full graphic capabilities
Kensington System Saver (built-in surge protector and fan)
Apple numeric keypad
original manuals
various Apple utility disks
enhanced Applewriter II software
PFS file and PFS report database software
Monogram Dollars and Sense
various game and other software

Both are in excellent working condition. Either system through retail or mail-order outlets would cost over $2000. Make an offer.

Send electronic mail to ihnp4!ihexp!wiso.

DAK has a VERY good reputation and I would suggest any of their products.
Remember, they have a 30 trial package on all their products. If you don't
like it (for any reason) just send it back for a full refund. I bought the
Olivetti Ink Jet printer (a $450 printer) for $199 and am very pleased.

     If you, or anyone is interested, you can buy a New Apple II+ motherboard for $200. 64K built in Z-80 card.
     Because it breaks a few copyright laws, I must insist that inquiries come through E-Mail or U.S. mail.
     Sorry, but that's the biz...

If this is the one with the carbon spark that deposits on the paper,
then yes, it does work. My parents got one for their apple. Be sure
to get plenty of supplies (electrodes, etc.) for this discontinued item.

Summary:

Can't be done with standard disk controllers. If you look closely at the
timing and data patterns used by the Apple hardware/software combination,
you find they are using a 1.5 density GCR scheme. All controller chips
implement only single density FM and double density MFM (or a few other
variants of MFM). On the other hand, the Apple controller uses less than a
dozen MSI chips and 256 bytes of 6502 code to operate! so it's a relatively
easy controller to emulate (which a few vendors have, as pointed out in
other articles).

Ascii express will emulate any of a number of terminals--there are
around 10 canned emulations-- or you can set appropriate parameters.
You have to remember that internally the software emulates a terminal
of some strange variety & a translation must be done to have it
appear as a vt52 to the outside world. On the incoming &
outgoing terminal selections, I believe the correct choices are 6 & 5.

I have been trying to use the Locksmith Nibble Editor (version5) to repair
a standard DOS disk which has had damage in some address fields for some
reason & have run into a few problems which I won't bore you with.
Can anyone tell me what the + & minus signs are that locksmith puts up after
an analysis routine is run? For example 22+. 22 is the routine number
and I gather a + stands for a successful and a - is an unsuccessful completion.
Although I am a manual skimmer, I did not see this explained.

     I have seen a few articles in using Ascii Express to set up
some Vt52 terminal simulation. There has been reference to using 5 &
6 to set this up. I'm not quite sure what this means. I have this soft-
ware but I don't have the manuals. I'd appreciate it if someone could
explain how to set this up. I'm looking for a Vt100 or Vt220 setup. I'm
also confused in setting up the software to autocall and autolink. Thanks
in advance!

Several people seem to think that Amiga has invented a new
ram type with their WCS (Writable Control Store (I know,
WCS usually refers to microcode, and some people don't
like using the term in the Amiga context, but that is
their flame)).

Fact is, the technique of putting operating system code
into RAM and write protecting it has been around for at
least 4 years. Apple does it with their 16k ram card.
Typically, the card holds Integer Basic or Applesoft;
some have moved DOS into the card and run Applesoft from
ROM (the ROM and write-protect RAM memory spaces coincide).

And, yes, it is nice to have the code in write-protect RAM.
As others have pointed out, the code is protected from
most user programs as if were in ROM, but can still be modified
as needed. The biggest drawback I can see will occur when
no disk drive will work and you want some basic 'monitor'
code in ROM for simple hardware checks. Many problems, at least
on Apples, could be troubleshooted using the monitor or entering
short assembly programs from the monitor.

Vertex Systems in Los Angeles, has a small board that plugs
into a slot in the PC which enables you to read and write Apple
disks directly. The board is called - wait for it - 'Apple Turnover'.
Not sure of the price. Their phone number is (213) 938-0857.

Yesterday my friend's mac made smoke signals (blue smoke came out from the top). When he called his supplier, he was told that they didn't have any spare parts, and that they had to order them in the US, so he is now without his mac for at least a month.

This might not be so bad, but my friend is an Apple distributor, and his supplier is the danish importer, so this means that there is NO spare parts to a mac in Denmark, and that every time something goes wrong, the parts have to be imported from the US.

Is this normal ? Why do I feel it is wrong to wait for a month to get your mac back ?

By the way, the problem with the mac was that the high-voltage part broke down (don't ask me what that means, but that was what the importer said).

This suddently make me realize, that I orderd a repair os my disk II for my old Apple II in november last year, and i am still waiting...

Have anybody else had problems with getting your Apple running after a breakdown ? What can one do, if the importer havn't got the parts ?

Thanks in advance

Noticing the //e in the top...is this unit equipped with a Duodisk?
Or did you buy the single disks? It seems that the newer mechanisms
do occasionally need to be realigned, while the older ones with the
Shugart guts had a reputation for never needing service aside from an
occasional speed-calibration and head cleaning.

Just a small(?) note: the Apple is not "re-syncing" the drive. It is trying
to restore track position. Most micros do this, but some do not do a very
good job of it. Commodore 1540 and 1541 drives are notorious for losing
alignment because their stops are adjustable, and the setscrews come lose
after a few minutes of use due to heat build-up in the under-ventilated
cases. Running the original copy program on protected disks and leaving
to grab some food caused many machines to be returned for service at the
computer store I used to work at. Re-syncing is accomplished by waiting
until the drive reads a self-sync byte, no more than a long string of ones.

Requesting Yet Another Shopping List, Please...

I'm looking for a Pascal compiler/interpreter for my Apple //c (i.e., 128K, 1 disk, 80-column support preferred). I don't want one so intensely that I'll spend $250 for UCSD -- I'm looking for something more along the lines of "Turbo Pascal" or a "Tiny-C" Pascal for about $100. Is Turbo available for the Apple without a Softcard or other Z-80 card? I once saw an advertisement for a "Kylan" Pascal, or somesuch for about $69. Anyone have any experience with this?

I'm also looking for a good terminal emulator program, <$200. My major considerations are 1200 baud (I have an external Hayes 1200 Smartmodem), 80-column support, VT-100 emulation preferred, uploading/downloading, and the ability to dump 'tee' the dialogue right to my printer. I realize that these are very loose definitions that many programs match (:-)), but if anyone has any suggestions, I'd appreciate them. Thanks in advance!!!

Summary: Right or wrong, thats what its called!

I beg to differ with you, Dave, but "resynching" is what this is called, throughout the microcomputer world. The usage is universal.

Regardless of whether it is meaningless or confusing, thats the term in general use. Most people can just about handle tracks and physical head motion, but don't understand *record* resyncing, so the conflict does not arise in practice.

I could probably use more of this advice than you, but for what its worth,

you shouldn't criticize until you understand...

It is true that when the disk drive gets "confused", it recalibrates the head
and makes a banging noise. However, there is a special reason for it doing so
when BLOADING a file that includes the section $400-$800 (hex) in memory.

The problem is in BLOADING because there are many important DOS variables that
are stored in that range. THe range from $400-$800 includes $400 bytes or
1024 bytes in decimal. In normal 40-column mode, there are 40 characters
across and 24 down, which multiply to 960 bytes needed to store text. The
other 64 bytes, scattered around not quite randomly in the text page.

When you BSAVE you include in the file all the current DOS variables in that
range, which do all sorts of things with the RWTS (read or write a track and
sector) routine. The RWTS routine is the one that causes your disk drive to
bang when you load a file into the text page. It loads the old variables
over the new ones and totally confuses the disk drive.

One solution, if it bothers you, is to load it somewhere else in memory and
then do a memory move.

Does anyone have information on availability of the Modula Corp. series
of compilers? The last I heard, all that was available for the Apple][
and Mac were beta test versions. Are they taking orders for real product
yet?

(If anyone is using a beta test version for the Apple][line, I'd
be interested in your comments.)

Also, does any company have plans to introduce either a p-code or m-code
(used on Modula Corp products - MEDOS is written in it) Native Code
Generator for the Apple][?

     Well, I can't recommend too much for the Mac. However, the
high-voltage section in the Mac shouldn't be too hard to fix using
stock parts, I should think.

     With the older Apples (II/II+) it's no problem, since they
were built with off the shelf parts (Not much of a budget for custom
chips then). The IIe is a different story since it has two or three
custom chips that take the pace of all the discrete logic in the
II/II+.

     The Disk II shoudldn't be tough to fix either. It's hardly
anything at all. I would say if your dealer can't or won't
fix it, find a friend who's not adverse to handling a
soldeiring iron and get him to put it back together.
(Assuming it's the circuitry, not the actual drive
mechanism.

>I am using the Beagle Bros. program GPLE. When I BLOAD the program,
>the disk sometimes bangs. It doesn't always do it, just sometimes.
>There doesn't seem to be a pattern. What could cause this?

DOS keeps pointers that inform it about the disk currently being accessed (slot, volume, drive) in a few unused bytes of the main text screen page ($400-$7FF). If the file being loaded overwrites these locations, DOS temporarily loses track of where things are. One of the things that happens is that the read/write head recalibrates (goes back to track 0, the only track on the disk it can locate absolutely; other tracks are found by offset from the current track), which is the banging noise you hear - the head bangs against the stopping point at track 0. This is also why the noise occurs when you boot a disk - DOS has no previous information on the location of the read/write head, and must recalibrate.

>Also, I once did a BSAVE on screen memory, and when I BLOADed it back
>using the same drive it was saved with, it doesn't rattle. When
>I use another drive it rattles. Does anybody know what is going on?

Yup. When you reload the file from the same drive, the bytes DOS uses in screen memory are overwritten with the *same values* they had when the file was saved, which are also the same values as the ones being overwritten when you reload the file from the same slot, drive, volume. If you switch drives, the "drive" pointer gets changed from "1" to "2" (or 2 to 1) by the loading of the file, causing the recalibration.

What to do about it? Ignore it. It does no harm. The only time I know of where it's a problem is with some hard disk systems. Programs that overwrite these locations may not load properly from a hard disk, because DOS will lose track of the correct volume number permanently. If this happens, resave the problem file with the appropriate volume number in place.

Here we go again...

> I beg to differ with you, Dave, but "resynching" is what this is called,
> throughout the microcomouter world. The usage is universal.

Funny, Ben, I'd never heard of that usage before - I've been designing disk
controllers and suchlike hardware for about 12 years now. The process of
recovering head position by moving to track zero is caller recalibration,
not "resynching". Resynchronisation is exactly that - correcting an error
in (or loss of) timing. The Apple's self-synch bytes are an example of a
device used for resynching.

Cheers,
Dick Binder   (The Stainless Steel Rat)

Does anybody know which signals are which on the modem port on the back of
the Apple //c ?

Please reply by mail. If there is enough interest I'll post to the net.

     I have had "banging" with one of my 8 year old single drives.
     In my case the symptom is slightly different in that it occurs
     only after the drive has set idle for some time (overnite).
     My guess is that the head somehow "settles" to an off track
     position. Does anyone know if DOS keeps the coils on the head
     stepper motor energized all the time (while the computer is on

at least)?

Dave Lowe

P.S. I don't have a //e, I have a][that has had EPROM brain surgery to make it a][+.

This information is available in the new IIc maintenance manual, available
from dealers for $50. It is in 2 volumes. I have a copy and will supply
the information tomorrow.

The following information is from the Apple IIc Reference Manual Vol.1.
Serial port 2------

pin number	function	
1	DTR	Data Terminal Ready
2	TD	Transmit Data
3	GND	Ground
4	RD	Receive Data
5	DSR	Data Set Ready

In addition the manual contains 18 more pages of information regarding serial
port number 2 and the use of it for communications.

I am in the process of broadening my understanding of the process of
hardware design and implementation by designing and building a coprocessor
for my Apple II+ with the following characteristics

     68008 at 8 mhz with one wait state
     32K EPROM
     128K CMOS DRAM
     RS-232 serial port with modem control
     Communication with 6502 or other coprocessors strictly
          through a pair of 512x8 high-speed FIFOs

I am well along in my own educational design right now and am part way
through assembling my prototype. I have no immediate commercial plans.
My interest in other 68008 co-processors has increased during this
process, however.

I would appreciate it if anyone could provide details or pointers to
the sources of details for other 68008 co-processors. I am especially
curious about the "DTACK Grounded" one, which has such a charming name.

Please mail replies to me. If sufficient interest is indicated I will
post a summary to the net. Thank you for your time.

Ramblings
By J Fields

5-16-85

Good things are showing up all over these days. Applied Engineering has a Z-80 addon kit for the Apple //c that lets us run CP/M on the 2-see. Apple is delivering the kit to make the //e completely compatible with //c. Ensemble and MacEnhancer arrive for the Mac, and Hawaii's beaches are once again filling up with good scenery from the mainland. What more can we ask for?

If you drop in on a friend and catch him/her at work on a Macintosh, the chances are that you will catch them using a Microsoft product. Sometimes it seems like Microsoft has cornered the market on getting things done with the Macintosh. Only two things are wrong with Microsoft products: 1) Copy protection, and 2) speed. Apart from these two shortcomings you should find unadulterated ease of use.

First, let's look at the shortcomings - in reverse order: Speed has been the common denominator for most Mac-complaints. Microsoft can not do much to make disk to memory transfer rates faster than 230K baud. Fortunately Apple seems to have found a way of improving the speed of the System and Finder in the surprise System Update delivered with the new version of Macwrite - Version 4.5. If you switch between applications often in the course of your day then you will want to try the new system's minifinder feature. It will save you considerable time switching between applications that you can keep on the same disk. Want a pat-on-the-back for buying Apple? The upgrade is available at no charge. Contact any authorized Apple dealer to obtain your update.

As for copy protection - doesn't everybody hate it? Microsoft believes *very* strongly in copy protecting their programs. Why?

A recent article in PC World says that Bill Gates (founder of Microsoft) was burned bad by piracy very early his career. As you probably know, Microsoft paved the way for programmers by giving us one of the very first Basic languages for microcomputers. It seems that right after he put the product on the market copies started turning up everywhere. Thousands of people were suddenly raving about the new Basic. When Bill checked he had only sold a hundred or so. There went his anticipated revenues.

If you've thought of depending on your own business for a living, then you may know how important a breakeven analysis is. If so, then you may appreciate what 10% product performance means. In any case, before we grumble about copy protection we should remember that we caused copy protection to be necessary in the beginning. Still, copy protection degrades considerably from the performance, or possible performance of Microsoft products on the Macintosh. Macintosh programs are tantalizingly slow loading. Stopping to insert the original for verification adds one more fly to the ointment. Consequently, I've taken to using one of my original disks as a work disk.

Yesterday something new happened to my *original* copy of Microsoft Word while using it. Upon booting I received a message saying "PLEASE INSERT WORD MASTER". I asked myself, "W.T.F.?" Obviously, something had *happened* to my disk. I

invisioned the weeks ahead using my backup and waiting for the damaged disk to be returned. What if something similar should happen to the backup disk?

To make a long story short, I found someone with a copy of Copy II Mac and used Bit Copy to back up the backup onto my original. I then ordered my own *original* Copy II Mac disk from:

Central Point Software, Inc.
9700 S.W. Capitol Hwy #100
Portland, OR 97219
(808) 244-5782

Price was only 29.95.

You would not hear me go on so about this except that otherwise I'm totally in love with Microsoft word. Multiple windows allow you to cut and paste between documents quickly. Want to see just one document full screen? Just double click on the title-bar and the small box popps up full-screen. Double click again and it returns to the smaller, more manageable size. Multiple windows are useful also if you want to make some global changes on a limitted part of your document. Select the text you want to work with, copy it, open a new window, paste, make changes then cut and paste back over the original text.

Glossary functions allow you to quickly change ms to Microsoft by pressing two keys. And you seldom have to take your hands off the keyboard once you've learned some of the secret key sequences. MS Word is probably the best word processor ever.

What's the difference between FACE and FADE? Try sixteen. Confused? Then try 10 Hex. I discovered this while trudging through Kane, Hawkins, & Leventhals' "68000 Assembly Language Programming." Trudge, trudge, trudge.

Hayden's ENSEMBLE is on the street now, and well ahead of Jazz. Looking at the guided tour disk that comes with it I would say that Hayden has a winner. The format seems a little unorthodox for the Mac, but I forgot the differences once I got going. Someone said that ENSEMBLE was originally developed in France. That might explain the slightly different approach of using Icons inside programs.

MacEnhancer is something many people have been waiting for. If you know someone who has put off getting their own Mac (and scrapping whatever rust-bait they're using now) simply because they already had a printer and could not see buying a new printer also, then let them know about the Enhancer. MacEnhancer (a Microsoft *hardware* product) lets you hook up any IBM (who?) compatible printer to your Mac. Only an arm and a leg, but you won't miss them - much.

Apple now has a bulletin board for dealers to use to communicate with techies. Lots of up to the minute tips can be found on various Apple-dom subjects. If your dealer does not know about this board ask them to save themselves some time dealing with your questions by finding out about it.

Speaking about dealers, the chances are that by the time you read this I'll be going to school full time. The good things Marv Weisman says about Charlie

Kong's machine language abilities have made me envious. Time for a re-tread back at the noodle factory. A recent pay cut also tells me that I have to find another way to earn a living. Not only do I have a carrot (incentive) in front of me, but someone's given me a kick in the butt (motivation) to get started. Who wants to wake up in five years doing the same thing and earning the same income while the people you work for seem to enjoy higher and higher standards of living?

I am having a problem with getting a new Anchor Signalman modem to work at
1200 baud. It works properly at 300 baud. Anchor has tested it and says
the modem is ok. One Apple dealer has looked at the computer and says all
is ok with it. The IIc works fine with a Novation Auto 1200 model at 1200
baud also. Could this be a typical case of the bad oscillator in the IIc,
which is supposed to be corrected in new production units, or has anyone
else had any experience with this combination?

Keywords: Motherboard

I have an Apple][+ with a motherboard that's older than Revision 7. This board will not accept the lowercase chip; it works only with Revision 7 or later. Would anyone (who doesn't need or use lowercase in their Rev 7 or later][+ motherboard) be willing to either sell or swap motherboards with me? (my board is in perfect working order).

My LDS church has a 64k Apple II+ with 1 floppy, running Applesoft (no CP/M), and they have asked me to put their membership records on it. The data base would include family-related items (i.e., address, phone, number of children, etc.) and individual-based items (i.e., age, hobbies, work hours, etc.). What is commercially available? Has anyone written such a program? I am hoping for a program that is not too disk-intensive, but if necessary I could have them purchase a hard disk or semi-disk. It would be nice for the program to be modifiable (implying BASIC) to customize the input/output formats. Any suggestions would be appreciated!

I bought the Olivetti PR-2300 ink jet printer form DAK some time ago. It works well and has great graphics capabilities. The problem is that the graphics are not compatable with many available programs (such as The Print Shop). Has anyone out there been successful in converting graphics designed for one of the popular printers (such as the Epson for example) to work on the PR-2300 ?

The interface board I am using is the modified Practical Peripherals' GraphiCard that DAK sold as a companion to the printer.

Has anyone got an Apple Pascal patch for the Megaflex card?
The manufacturer no longer supports the card or software, so
my only hope is to find someone that has a copy...

Please reply via mail or US mail or phone

While we are on the subject, does anybody know if there is a ramdisk
driver for the PCPI applicard that works with the RAMWORKS card? (I.e,
that uses the RAMWORKS memory for its ramdisk.) Presumably if there were
one it would also work with the Apple 80 col card. Please save me from
re-inventing the wheel. If I can't buy one, I will have to write it
myself.

I have the following items (in perfect condition) available for sale:

1 Apple Profile // 5 Megabyte hard disk with interface and cables. Supports
  ProDOS, software available elsewhere for DOS and Pascal. $600

1 Corvus 6AP 5 Megabyte hard disk with interface, cables, manuals, and software
  for DOS, Pascal, and Microsoft CP/M. $600

3 Apple //e extended 80 column text cards. $35 each

1 Microsoft Z-80 softcard with manuals and software. $100

1 Videx Videoterm 80-column video card with manual. $100

If you are interested in any of these items, please contact me.

Thanks to all for the tremendous response I've had suggesting terminal programs and Pascal compilers. I apologize to those to whom I was unable to reply -- I'm still a rookie at "riding the Net" and generate a lot of "UNABLE TO SEND" messages. The following is the summary of the responses and other investigations.

The two most suggested programs were Ascii Express Professional by United Software and Softerm II from Softronics. Ascii Express Professional runs quite a bit cheaper than Softerm II, and though it supports 1200 baud and other important features, it does not support the VT100 terminal emulation I require. Softerm II also includes a "mini-keypad," according to one of the respondents, for special functions. Softerm II lists for $195 and is available from Softronics, Inc in Memphis, Tenn.

Apple's "Apple Access" was also suggested, and does have VT100 emulation as an "ANSI" terminal type. I have no pricing information or other respondents' comments.

In general, most of the Pascal suggestions involved either installing the Z-80 processor for my //c and purchasing Turbo Pascal, or trying to buy an old or used version of UCSD Pascal, perhaps Version 1.1. Neither of those interested me, so I went ahead and purchased Kyan Pascal from Kyan Software, 1850 Union Street, Suite 183, San Francisco, CA, 94123. For $69.95, the package includes a Pascal to 6502 Machine Code Compiler, an Assembler, and a Full-Screen Editor. I played with the package over the Memorial Day Weekend and enjoyed it tremendously.

I'm not very familiar with Pascal -- my experiences are limited to trying to implement interrupt routines in Apple UCSD Pascal on a II+ and reading parts of Peter Grogono's "Programming with Pascal" -- so I can't be a great judge of the compiler, but I was able to type in the Tower of Hanoi program from Grogono's book, without modification, and had it compile and execute the first time. I put together a program to assemble and print a linked list, with a 'dispose()' statement, and it ran fine.

It's Prodos-based, but only uses 64K, so by loading the editor and my source into the RAM disk, my compiles and editing sessions were really quick. They claim to be twice as fast as Turbo Pascal and four times the speed of Apple UCSD Pascal. You can have include files, and in-line

assembly language.

 However, you are getting a $69.95 package, and not the $250 UCSD stuff,
and it shows. I haven't encountered any bugs, yet, but I've found several
"annoyances." For example, errors on the command line are met with "PRODOS
ERROR " and a hexadecimal Prodos error code, a rather unfriendly error message.
The compiler takes command line options such as printing the assembler code
as the Pascal is compiled (a really nice feature in my opinion), dumping
the error messages to a specific device, and sending the object code to a
specified file or eliminating it completely. Unfortunately, the manual's
command-line examples do not work, and I discovered by trial-and-error that
only one option may be selected at a time, a limitation not mentioned in
the manual.

 Again, thanks for all the help.
    Mark

Does anyone out in net land know of a BBS program that works on an
Apple][c?

I have a friend who is looking to start one, but all of the software
seems to be written for either a Hayse Micromodem 2e or an Applecat,
both of which require slots. Unfortunantly Mr. Jobs doesn't like
slots any more.

Your E-mailed responses would be appriciated.

Lines: 89

I have a question/problem. I'm writing several timing routines in
software but they are a bit off and I can't figure out why. On a
1.023 MhZ Apple II there should be 1023 6502 cycles in a millisecond.
Below I have a routine that waits a number of milliseconds. Each
loop traversal takes up 1023 cycles (or one millisecond). I have
compared the time on a //e and II+ and against two Mountain Hardware
clocks and the clocks say that the wait routine is about 2.5 clock
cycles too slow (error rate of .25%). Why? Are the Mountain Hardware
clocks off by this much (has anyone testing them)? Is the Apple crystal
(or whatever sets the frequency) really 1.0205 MhZ? Am I doing something
really stupid in my software routine below?

-Thanks, david neves

Now that the hoopla has died down, I would like to
know just how good/bad the Sider 10Mb drive is with
the Apple. To wit:

 * Any problems?
 * Does it really work with DOS3.3,Prodos,CP/M2.2,Pascal?
 * How easily do the aforementioned op systems co-exist?
 * How easily can you boot from one system to the other?

   .. please mail responses to:

                          Charles Lord

Has anyone tried the RTTY/CW/ASCII package for the Apple][called Egbert?
I would be interested in any comments.

Hi folks,

I have a question on Turb-Pascal.

Has anybody out there tried to write interrupt procedures
in Turbo-Pascal on CP/M 2.23 on an Apple II+ with a
Microsoft Softcard. Has anybody tried to write interrupt
procedures on the same configuration in assembler. I have
tried it, but the documentation seems to be not
always correct in the parts about machine-level and
interrupt programming, so my program doesn't work correct.

I'm interested in any help how to catch the interrupts on
both processors (6502 - Apple / Z80 - MS-Softcard) correct.

Thanks in advance

     It's frustrating to have to use several different editors for different terminals, different computers and different purposes. After spending the day using vi, then ed, then a lisp editor, then a Cyber line editor, it's embarrassing to volunteer to help your relatives type their term papers on your home micro and then not remember the first thing about how to use it.
     In thinking about what would be a good home word processing program, then, I realized that if vi were implemented for micros, this problem would be solved. Also, vi is simply an excellent editor in its own right.
     Does anyone know:
     -Is it legal to create a micro editor which has the same command formats (or, realistically, a good subset thereof) as vi?
     -Has it been done, commercially or privately, and for which micro(s)? I'm interested in getting one, or writing one, for the Apple][+ myself.
     I'll summarize mail responses to the net, if warranted. Thanks.

Hello All,
     My company is planning to buy an Apple IIe to hook up with a Gerbert Signmaker IV. I was wondering if anyone else in net-land has heard about this or has any info on this subject.
See ya...

There is no legal problem with creating a micro "vi" so long as you
do not use licensed source code to do so.

Manx Software Systems (the Aztec C people) have a vi-compatible
editor for the Apple II. I think their HQ is in Shrewsbury, NJ;
they advertise in some of the micro mags.

()

I recently received an advertisement from Broadreach
for Wordstar and the Appli-Card CP/M card for $164.95.

It lists features of the Aooli-Card, but doesn't specify
whether all the software and manuals necessary to use
the features are included in the package.

If anyone has experience with the Appli-Card, or this offer,
please send me your opinion.

In particular, does the 6Mhz Appli-card run all CP/M software?
Are preboots needed?
Is the manual sufficient to learn CP/M?
Are there needed utilities that are not included with Appli-Card?
The ad says the 64K ram on the card can be used as
RAM/Disk for DOS3.3. Has anyone used the Applicard in
this way?

Thanks,

     David Lazar

You might consider JOVE, a public domain version of the EMACS editor, which runs on the IBM PC under MS-DOS and 4.2bsd Unix, at least. I have not used it on 4.2bsd (yet) but it works well on the PC. It's large (ca. 100K) but far smaller than the PD EMACS from the GNU project, which is the full-blown version. Keyboard bindings are arbitrary in JOVE, but it lacks extensibility and LISP support ... in my view, an excellent tradeoff for size.

Help! I need some ideas for a good database/file manager for the Apple][e. Major requirements are these:

1) Flexibility of record format after set-up
2) Large field size (> 256 chars if possible)
3) 80 columns
4) Large number of records per file (~= 750 or so), which implies:
5) Spreading files over multiple disks
6) Optional: Upgradable to hard disk in the future; also
Compatible with Quark's Word Juggler vers. 2.8
7) Reasonable price, < $150 if at all possible.

My hardware config is][e w/80 cols, 128k, an Imagewriter, and DuoDisk drives. I can support UCSD Pascal 1.1, ProDOS and DOS 3.3.
Thanks in advance for your help! If you'll reply by e-mail, I will condense answers in a follow-up article.
Hopefully,
Michael Auman !decvax!mcnc!ecsvax!etaoin

Due to the amazing response to my previous posting (none!), I have lowered my asking price for the two hard disk drives for the Apple II to $450 each.

1) Corvus 6AP 5 Megabyte with controller, cables, manuals, and software for Apple DOS, Pascal, and Microsoft CP/M.

2) Apple Profile II 5 Megabyte with controller and cables. Works with Apple's ProDOS. Software available elsewhere for Pascal and Apple DOS.

If you are interested, send me a line. I would like to ship UPS COD for a cashier's check or money order, but other arrangements can be made.

The time has come for me to summarize what I have learned about the PCPI Applicard for all you folks out there who have helped me in my search for information.

First -- The manuals that come with the Starcard (The name for the Applicard when it is bundled with Wordstar.) are full of typos and not exceedingly detailed. If you can read around the typos, they are reasonably good cook-books for getting CPM and Wordstar up and running, but they will not make a CPM hacker out of you. I have not heard that PCPI's own manuals are any better. All is not completely lost though, because there is a friendly person at the end of a PCPI technical hot-line who can send you xerox copies of various napkins (and such) on on which the software/hardware developers have scribbled down the real poop. In addition, there is an 'OEM Package' that PCPI will sell you for 50 bucks which consists of a double-sided disk full of software and about 35 pages of badly xeroxed notes. The above mentioned napkins are in addition to these notes, and necessary for a real understanding of what is going on. If you have looked at all of the above and are still curious about what is going on, you can offer to sign a non-disclosure agreement, and they may consent to send you the source code for the various drivers. Then again, they may not. I haven't gotten my copy of the non-disclosure agreement yet, so I don't know how stringent it is, or what happens after you sign it and send it back to them.

Second -- It runs CPM2.2 just great. I have Turbo Pascal for CPM/80 running on it and am much impressed with the speed and convenience of the package. The 6MHZ Z80B processor is *FAST*. On the other hand, since the Z80 and the 6502 do not share any memory, (The Z80 has its own 64K of fast DRAM. You can buy a piggy-back card that will expand it to about a half-Meg) the communication between the two cpu's is restricted to a single one-byte-wide I/O port and a couple of flag bits. Even with a dedicated server running on the 6502, this means that the Z80 can't write on the Apple's 80col screen at higher than a few hundred characters/second. (Disk accesses are significantly faster, because they use block-mode transfers in which the Z80 tells the 6502 how many characters to expect then sends them all in a burst. Character devices like the 80col screen are restricted to a single byte at a time, so the overhead is much higher.) Since the nitty-gritty I/O is all handled by the 6502 side, the BIOS on the Z80 side can afford to be very small. This leads to a remarkably large 57K Transient Program Area. You can run larger programs on it than you can on the Microsoft card. (Further comments on differences between this card and the Microsoft card later.)

Third -- The terminal emulator that runs on the 6502 side and manipulates the Apple 80col screen is excessively dumb. It seems to lack character/line insert/delete sequences. If anybody knows differently, please speak up. It hurts to watch the screen get repainted just to insert a line at the top. I sincerely hope that this is just a misfeature of the Turbo Pascal editor, which I otherwise like very much.

Fourth -- it is *not* compatible with the Microsoft CPM card. It will not run anything that assumes hardware features of that card. However, it *will* run just about any generic CPM program, of which there are a multitude! The price you pay for the blazingly fast CPU is incompatibility with the 'standard' Microsoft card. The worst part of this is that it will not run the drivers that give you access to the Profile hard disk from CPM. (Does anybody know if the Sider has a driver that runs on the Applicard?) The person on the hot-line hinted that PCPI would sell you a driver written by someone in Australia that gave the Applicard access to a Profile, but he didn't make it sound like it was compatible with much. In particular, I think he said that if you used that driver, you couldn't use your Profile with Prodos. He didn't know for sure, but I expect that there is no provision for partitioning the disk. I asked about software from third-party sources, but (while he said they did keep a registry of such) he couldn't point me at anybody who could help me with my specific problems. Which brings me to --

Fifth -- They supply a driver that runs under DOS3.3 and turns the Applicard into a ramdisk, with up to a half meg of memory if you buy the piggyback cards (300 bucks for 256K -- a trifle expensive for today's market -- maybe mailorder places have them cheaper.) However, they do not supply a corresponding driver for Prodos. I assume that the Prodos driver would be a snap, given the code for the DOS3.3 driver, but nobody at PCPI has seen fit to do it yet. Sounds like a market for a 3rd party in there somewhere! I have used the DOS3.3 driver, it works very well.

Sixth and finally -- They supply a printer driver that uses the left-over 6502-side ram (including the Alternate bank on the 80-column card, if one exists) as a printer buffer (up to 80K in my configuration, IIe with extended 80 Column color card.) But it seems to me that a much better use for that memory would be as a ramdisk for CPM (with maybe a 16K buffer reserved for the printer driver.) The tech-support hot-line person did not know of any such driver -- sounds like another 3rd party opportunity!

>
> I recently received an advertisement from Broadreach
> for Wordstar and the Appli-Card CP/M card for $164.95.

This is a very good price!

> It lists features of the Appli-Card, but doesn't specify
> whether all the software and manuals necessary to use
> the features are included in the package.

If this is the Micropro Starcard package, they are included, but see above. The manuals are not very detailed.

> If anyone has experience with the Appli-Card, or this offer,
> please send me your opinion.
>
> In particular, does the 6Mhz Appli-card run all CP/M software?

> Are preboots needed?

Runs everything I have come across, but I have not experimented widely.
Also, see above regarding Microsoft compatibility.

> Is the manual sufficient to learn CP/M?

No. Go buy a good book. Don't count on the manuals.

> Are there needed utilities that are not included with Appli-Card?

Everything you need to configure it and get CPM up and running is included.
There is the DRI assembler and editor and DDT (and PIP and stat, and so on)
but no 'higher level' languages. I recommend buying Turbo Pascal.

> The ad says the 64K ram on the card can be used as
> RAM/Disk for DOS3.3. Has anyone used the Applicard in

Can the Sider info be posted (again?), instead of mailed? I for one
missed anything about it so far, because we just netted up. I would
appreciate it if this is done. (Or better yet, C Lord mail it to me?)

Thanks..

The Manx/Aztec C compiler for the Apple II contains a Ved editor which is
essentially a stripped down version of Vi.

Unfortunately, the text files it produces have the high order bit of
each byte set to 0 (like the rest of the world) instead of 1, like most
Apple II text files. I wrote a conversion program. (trivial C program)
but it is still a pain to convert.

Also, what do you plan to do with your text file once you write it?

Most Apple II text processors come with their own built-in editors. Text
file manipulation of Apple II's is generally chaotic as many firms use their
own private binary formats.

There is a very good subset of vi which runs on the Macintosh
with the Aztec C compiler, or on IBM PCs (bleah!) with MS-DOS.
It is called 'z', marketed bu Manx Software, and you will find
it hard to find a command which vi has and it doesn't. It is
just missing a couple of the 'ex' underlying commands. It will
yank text, redraw screen, read files, it does everything I use.
I don't know if it exists for the Apple][, but as you see, it is
available for micros. Good luck,

We are about to buy a couple of MacIntosh and Sun-2. The Macs are to be
connected via AppleTalk. Now I wonder the following:

1. In a posting Aug 28, 1984, a specification for the hardware for an
   Applebus - Ethernet Gateway by Bill Croft & Nick Veizades, Stanford
   Sumex project. Is that still the best way to go? Is there any
   commersial products that makes a Sun with the Multibus to talk to
   AppleNet?

2. If we can make the Sun talk to the AppleNet, we want to make the Sun
   to act as a FileServer for the MacIntoshes. Has anybody done that?
   Has anybody tried? Anything we should be aware of?

Somehow I think someone must have thought about this before so I try the
net. I hope for an answer, positive or negative.

Xref: watmath net.lan:851 net.micro.mac:1627 net.micro.apple:1954

We will soon have a couple of dozens of MacIntosh connected to some
AppleNets (or is it named AppleTalk?). Hopefully we will be able to connect
them to a Sun acting as a file server.

But aside from fileaccess we also want to have terminal access to the Sun
(or to any machine in the house). I do NOT want to lay out cables from every
Mac to the host or to any centralized switch. Every room will be passed by
an ethernetcable and an AppleNet. So the abvious solution is to connect the
Mac (or any common async terminal) to one of the nets.

But the black boxes that connect a asyncrounous terminal to ethernet is
rather expensive. I want to be able to use any kind of host at the other
end, i.e. the solution with Dec LAT and Decnet is not possible. Also I
want 1 (one) box to 1 (one) terminal it would be rather expensive.

So what about the other net, AppleNet? Low-speed and low-cost... Has anybody
made some kind of black box that takes the asyncounous bytes and packs them
into an AppleNet packet, send them away to an unpacker which presents the
bytes asyncrounously to some kind of host? Those boxes must be much cheaper
than Ethernetboxes, but how cheap?

Maybe some patching can be done in a Mac to steal the bytes to be output on
the ttyport and send them via the AppleNet (after some packaging of course).
Maybe the AppleNet to Multibus i/f I am looking for in an other article and
some smart driver in the Sun will make it.

Anybody in the same thoughts? Anybody done it? Anybody interested if we make
it?

I summarize any answers to the net of course.

Hans

Has anybody had timing problems using the CP/M Softcard? I have
built the II+ revision RFI clone and have full documentation for
both motherboard and Softcard. Whether CP/M 60 boots or not
depends on tolerances of many chips on the: motherboard, +16k,
Softcard, and even VIDEX card. Some configurations work. The
problem occurs while booting, it is hard to trace anything.
Some people say, that the Softcard has a critical timing. Does
anybody know what measurable signal is critical, or has anybody
had a similar experience?

> clocks off by this much (has anyone testing them)? Is the Apple crystal
> (or whatever sets the frequency) really 1.0205 MHz? Am I doing something
> really stupid in my software routine below?

David Neves:

I too was once puzzled by seeming timing discrepancies. While showing my computer and Mountain Music synthesizer cards to my piano tuner, he commented on the pitch being slightly off. He got out his old-fashioned strobe tuner, and I poked various values into the frequency register on the synthesizer card until I hit 440 Hz. Later my calculations showed that the apple was running at 1.0205 MHz, yet the note tables had all been calculated using 1.023 MHz. It was a mystery to me until I read "Understanding the Apple II" by Jim Sather. Here I quote Mr. Sather.

> The timing feedback from the video scanner elongates
> one system clock period at the end of each horizontal
> television scan. This elongation is necessary to keep
> colors consistent from scan to scan. It also means the
> clock period of the 6502 is not constant but is
> elongated on every 65th cycle. (p. 3-2)
>
> The composite frequency of the Apple is 1.0205 MHz.
> 1.0205 is the result of 14.31818*(65/(65*14+2))....
> This is the value which should be used for computing
> exact time durations of Apple programs....
> When possible, [program] loops should be written in
> multiples of 65 cycles. This will eliminate loop
> output jitter. Otherwise the application must be able
> to tolerate a 140 nanosecond jitter. 140 nanoseconds
> is the difference between a normal cycle and a long
> cycle. (p. 3-18)

Mr. Sather goes into much more detail. Actually Sather's book
is a must for all serious Apple hackers. Although it is for
the II and II+, many sections still hold for the IIe. Also, I think
that Mr. Sather now has a book just for the IIe.

Hope I've helped,   Bruce Holmer
                        holmer@ucbdali

In reply to a usenet inquiry about EPROM Programmers:

Short of the expensive professional systems, there are a number of
them that I know of. Some are for internal use as an expansion board
in the Apple][series.

     Jameco Electronics (Belmont, CA) has a fairly expensive (and
     extensive) system. It does 8k to 64k, and costs $995.
     With RS232c interface option, cost is $1195.
     An IBC-PC Communications Program for it is $50.

The following (but not exclusive list of) companies have Apple plug-in

boards:

     JDR Microdevices ($79.95) 16k to 128k

     Southern California Research Group ($149.50) 16k to 512k
          (we have used this one here, without incident)
          (we have used this one here, without incidp
     Supreme Wholesale (in San Jose) ($59) -no information

In-reply-to: your article <7171@watdaisy.UUCP>

The distribution technique you describe is sometimes called 'share-ware'
and I have seen a few things distributed that way. I like the idea very much.

Usually, the appeal for contributions includes a promise of some kind of
support for those who send in their money. To further sweeten the pot, I have
heard of at a variation on the 'support' theme in which you send in your money
along with a copy of the diskette you are using. The author will send it back
with the 'latest' version and a 'unique serial number' electronically encoded.
(A time and date stamp would do fine for a serial number). The person who
owns the serial number on the disk you sent in then gets a cut from
your contribution. Anybody you give a copy of your own diskette to who sends
in his contribution will wind up paying you a 'sales commission' just like you
paid the person who owned the copy you sent in. The beauty of this scheme is
that pirates make *no* money from it. They actually wind up *helping* the
authors and legitimate users to get their fair share by providing the widest
possible distribution.

The biggest problem (assuming that you have a quality product, that will sell
itself to anyone who gets to play with it for a while.) is getting a wide
enough initial distribution.

Net.sources doesn't seem to be the ideal method (very likely flames from
people on the net about commercial use of the medium, etc.) Maybe a short
note in net.general and net.wanted describing the 'product' and offering
to send a (free) copy of your shareware for evaluation to people who mail you
a stamped self addressed floppy.

The users on other bulletin board systems may not be so touchy as the netnews
folks.
Maybe the 'private' BBS's are the right way to get something like this started.

There seems to be nobody in the world who knows that the 65802 is
not a product of Western Digital. Even the trade papers get it
wrong!

The 65802 is a product of Western Design Center, in Mesa, Arizona.

I don't know if it's available yet or not.

I have recently purchased an apple //c and I would

like any info anybody has on Pascal and/or C compilers.
What compiler is the best, what utilities come with
the compilers, which ones compile the fastest, which
ones generate the smallest object code?

Thanks in advance,
Chris Barbay

I want to communicate with a UNIX 4.2 BSD system using my Apple II+.
I am told that Kermit-65 is my best bet for this, but that it is
better to get a copy on disk rather than try to download it. If anyone
can help me obtain Kermit-65 for the Apple on disk I would appreciate
it very much. I would be happy to send a blank disk. (I am assuming that
this software is PD.) Thanks!

I wrote a ram disk driver for DOS3.3 and took care to not use the
hires graphics pages of the aux mem as disk areas (user optioned).
In looking at the PRODOS /ram disk area, they blow away the hires
pages for disk blocks, so you have a choice of double hires or /ram.
Does anyone out there know the memory mapping of the aux mem ram
disk so i can zap the sector-use bits to mark the high-res pages as
used? It would be very nice to have a smaller /ram AND have the
double hires areas...

Although Apple states that the IIC serial port is almost exactly the same as the Apple IIE Super Serial card, it is not. I am looking for the commands to the serial port that set line feeds on/off and control carriage return delay (nulls). I am referring to the Control-A command codes. Please send all responses to: ihnp4!hound!5132ts2 Thanks.

My assertion was in response to a posting claiming registration was in fact a prerequisite for a suit, which is simply not so. The claim that "unregistered works are not really protected" belied by a whole pile of case law. (A recent well-publicised example being the victory of Ellison and Bova over a television network.) In fact, the ability to register an unpublished work is an innovation less than a decade old. Please understand that I am not suggesting that registration is unwise as it leads to the practical advantage you describe and grants further rights under the statute (including punitive damages).

> > Copying a part of a book for limited use

[...sample copyright notice and warning curse...]
> Such a statement is crystal clear - you copy my book, even one page, and if I
> find out about it I'll roast you over a slow fire.

I don't know about barbequing or compelled firewalking, but you'd have no standing in court. Like the ubiquitous NOT RESPONSIBLE FOR INJURIES... signs, the book notice has no legal force. A copyright page notice cannot rewrite the statute, which very explicitly says that you CAN copy portions of the work under the defined limits of fair use. Take a moment to read the statute, or the excellent American Library Association publication that also summarises the case law. (By the way, there is even a provision of MANDATORY licensing of some works, with royalty being set by a government tribunal.)

> expectation, or at least hope, of a return.
> Dick Binder (The Stainless Steel Rat)

Dear Stainless, I agree with you. Sorry I didn't make that sufficiently clear. What I was getting at was that there is nothing magical about rights to physical property. I consider intellectualy property every bit as "real" (in the philosophical, not legal, sense) as physical.

There are at least two ther ML debuggers I know of. One is callded
BUGBYTER, and I understand it is available on APPLE's DOS Toolkit
Disk, along with their EDASM assembler, font gen, etc.

Another is MUNCH-A-BUG, by Roger Wagner Publishing, PO Box 582,
Santee, CA 92071, (619)562-3670. It lists at $40, but I just ordered
it from Northeastern Software for $25. This has the same features
mentioned in the previous posting above.

Is there a version of Rogue for an Apple IIe or IIc? I played briefly yesterday and would like to play it at home. I have a few compilers (c,pascal, fortran) so either the source or object would be fine. Is it public Domain, or must it be bought? If so, from who? Thanks,

Andrew Rahme

Hello chris.

I really dont know too much about the IIc but as for the IIe and the II+ the best c compiler is known to be the aztec c. I use this complier and it is quite good. I read some write-ups about this compiler and the bottom line is this:

language	running time
applesoft	2000 sec
apple pascal	500 sec
aztec c	40,20 sec

this bench mark was done using the same algorithm for each languages above (I think it was a prime numbers algorithm). The reason there are two running time for aztec c is that there are two ways to compile in the aztec c.
The faster time is for compiling in native 6502(which is supposed to use more memory, but will be of greater use). I read all this long time ago in a magazinelong ago. I am pretty sure I'm right about this but I can't guarentee it. The aztec c should run on the IIc also.

As for pascal I use the Apple pascal 1.2. I can't say i really recomend this compiler. I've heard the Turbo pascal is really good. But you'll have problems putting a Z80 in your IIc. You'll have to stick to Apple pascal. I hope I was of some help.

Jong

ps. This is my friends account, so keep the respose short.

Has anyone put their own hard disk system together? I would be
interested in doing such a thing if I could do it for around $500
(for a 10 meg system). I've seen an ad for Xebec Apple controller
for around $375 (where can I get documentation for it?). What other
Apple hard disk controllers are there and how much? Basically I'm a
software person, not into hardware, so I wouldn't want to build my
own controller.

I read an article in this group the other day that mentioned 6 Mhz Z80 cards available for Apple][+.

I have the Microsoft Softcard for the Apple already, but it's slow, & I'd like a faster Z-80.

So... has anyone used a 6 Mhz card ? Are they good ? Prices (from discount places, hopefully) ?? Do they work as seamlessly as SoftCard ?

Reply to me, I'll post a summary later.

Fangs a lot !

I was going through my old disks and came across an adventure game called Empire I World Builders. Has anyone played this game? I can't get very far in it, I keep getting killed. Do you have any hints for this game? any comments would be appreciated.

Andrew Rahme.

You can probably find quite a few people with the source to
an older version of Rogue, generally version 3.6, and it is
written in C, but don't expect to get it working on your
Apple. Even with separate I&D spaces and text overlays, it
was hard to build a PDP-11 version. It's just too big!

Lines: 20
Summary:

Applied Engineering has been advertising a Z-80 card for the Apple
//c. I'm not sure how it installs, but it fits in the case and lets
you use CP/M on the //c, so that opens up Turbo Pascal as a choice of
Pascal compilers on the //c.

Personally, I have both Apple Pascal and Turbo Pascal on my //e. I
never use Apple Pascal anymore unless I need graphics or I'm writing
something for someone without a Z-80 card. Turbo is so much faster,
and I usually find I need all the speed I can get. And neither
compiler even comes close to the performance I get from my Aztec C
compiler. The Aztec compiler itself is extreeeeeeemmmmely slow, but
the resultant code is quite fast, much faster than the code produced
by either Turbo or Apple Pascal.

Aztec runs on the //c as well as the // and //e. So now you have your
choice. Most anything's better than Applesoft.

Does anyone know where to get-nuts-and-bolts technical information
about the PCPI Applicard? I was recently given one as a gift by
someone who got it for free as part of a package with wordstar
software. He already had a CPM card for his Apple II clone, so he

didn't need the Applicard, and gave it to me. Unfortunately the
documentation he got with it is *very basic*, tells you how to plug it
in and run wordstar on it, period! I dont want to run wordstar, but I
would like to run Turbo Pascal on it, and the things I want to do with
it involve needing to know the details of the communication between
the 6502 and the Z80.

Pointers to good books would be most helpful.

Replys by email and I will summarize for the net if there is enough
interest.

Thanks in advance

Has anyone figured out what the 'RAMDISK.DVR' is used for? It's on the system
master that came with the PCPI card. I expect it turns the extra apple memory
into a ramdisk, and works sorta like buffer. (I haven't installed both at the
same time.) If you know, please say exactly how your drivers program is set
up and what order.

thanks in advance.....

I heared that the StarCard CP/M card that can be bought with
Wordstar is really a PCPI 6mhz card. If this is true,
does any one know if it comes with the CP/M utilities and
manuals?.

I saw a place advertising it for ~$150....

My brother just got mousepaint for his Apple II, and discovered that he
couldn't print anything unless he has an Apple printer and interface.
He does have a perfectly good Epson with graphics, but he can't seem to
get mousepaint (running under ProDOS) to leave a file behind that the
printer dump program can read. The local computer store gave him a copy
of ProDOS to use, but it won't boot on the Apple II (seems to need
newer ROMs like those in II+ or //e). Any ideas?

I have been developing software for a number of micros and currently
use Apple Pascal for The Apple II line. However, I am running into
many situations where a customer does not want to buy AP just to run
my programs. Also, I don't care to pay Softech's high royalties for
distributing run-time packages. Sooooo...

Concerning Aztec's C package for the Apple II :

1) Does anyone have opinions (good, bad) on it?
2) Does the native 6502 code produced require substantially more disk
space than p-code?
3) Will I find that I really miss my Apple Pascal?

Please mail me any info that you can.

Thanks in advance,

Frank

*** MASSAGE THIS LINE WITH YOUR PLACE ***

Yeah, the PCPI 'starcard' is one of the best CP/M cards available on the apple. I got it for ~ $185 and thought it was a steal. If you see it lower, GET IT! It comes with CP/M primer, Wordstar 3.3 + manual, CP/M system disk which includes drivers for 80 col cards or 70 col hi-res (goes slow, but works). The card itself is fast. It also comes with the starcard manual which explains all you need except for one of the drivers. (I still can't figure out what RAMDISK.DVR is used for. Maybe for the 256K Add-on ramdisk you can install...) The WS manual is geared for using the PCPI card, too.

You have your basic cp/m utilities: stat, submit, etc. & one called adosxfer which transfers files back and forth between dos 3.3 and cp/m. There is also a file called dosrdsk or something, which, when transferred to dos 3.3, can make the extra 64K on the starcard emulate a ramdisk. When you're using the card, you can change the apple memory into a printer buffer (35K or so!)

I have used my card for about 3 weeks now (I only have 1 drive and am in pain...you really need 2 ++). I do recommend it to *anyone* with a //e who wants cp/m. I've used cp/m 3.0 before, but the novelty of cp/m on an apple makes me forget the problems of cp/m 2.2 .

I asked about the new instructions in the 65C02 but didn't get
any answer. I just found out the answer by looking in the new manual from
Apple.

(based on pages in About your enhanced Apple //e: Programmer's guide)

65C02 new instructions:
BRA -   Branch relative always
DEA -   Decrement accumulator
INA -   Increment accumulator
PHX -   Push X on stack
PHY -   Push Y on stack
PLX -   Pull X from stack
PLY -   Pull Y from stack
STZ -   Store zero (Absolute, ABS,X , Zero page, ZPG,X)
TRB -   Test and reset memory bits with accumulator(Absolute, Zero pg)
TSB -   Test and set memory bits with accumulator(Absolute, Zero pg)

New Instruction addressing modes:

The following include a new ZPG addressing mode. This is Zero page indirect
addressing. (It used to be the case you needed to use the x or y registers
to do this kind of addressing)
ADC, AND, BIT (also ABS,X), CMP, EOR, LDA, ORA, SBC, STA

JMP (ABS(IND,X)) ;the contents of the second and third instruction bytes are
  added to the x register. The result is a memory location with the
  address. I think what this means is: JMP (3000,X), you add 3000 + x and
  the result is a memory location with the address to jump to.

Some people are confused as to the documentation sold by Apple. Dealers
don't help very much because they don't make much profit from setting
manuals. What follows is what Apple distributes for the Apple II line.

Apple #	Name	Retail $
A2L2072	Apple IIe Enhancement Programmer's Guide	none
A2L2073	Apple IIe Enhanced Owner's Manual	$20
A2L2005	Apple IIe Reference Manual	$30
A2L4030	Apple IIc Reference Manual	$50
A2L2002	DOS Users Manual	$20
A2L2012	DOS Programmers Manual	$20
A2W0010	ProDOS Technical Reference Manual	$25

Manuals available from Addison-Wesley Publishing (1-800-238-3801)
  AppleSoft Programmer's Kit (IIe & IIc)
  AppleSoft Reference Manual (IIe & IIc)
  AppleSoft Tutorial (IIe & IIc)
  BASIC Programming with ProDOS

Other things ...

A2M2052	Apple IIe Enhancement Kit	$70

```
         ;Price includes $20 for installation.  Most likely the
         ;dealer will play dumb about this installation fee if
         ;you want to do it yourself to save $.
```

Yep! It is just that. The manuals that come with it are abominable.
However, there is a 50 dollar 'developers manual' available from PCPI.
I ordered one yesterday. I'll post more info after I have looked at the
it. I'm told that the Applicard/Starcard will not run Microsoft basic
(either Mbasic or Gbasic) but have heard rumors that PCPI will sell
a patch to basic (one or the other or both??? Anybody know for sure?)
that solves the problem. The Starcard comes with one 'flippy' disk
with CPM and the basic cpm utilities on it (PIP, STAT, ED, etc. but not Basic).

Rick Thomas
{ihnp4, akgua, just about anywhere}!attunix!rbt

PS -- I have also heard rumors that PCPI is 'going big blue' and is not
interested in pushing their Apple products anymore. Could this explain the low
price for the Starcard?

Does anyone know if the 65802 is available yet? When I called
Western Design Center in Mesa Arizona in fall of last year they
sent me some literature and were prepared to take $100 from me
in return for a promise to deliver a 1MHz sample but I didn't
believe that they really had any samples so I didn't order.

Has anyone ordered? Did you get your sample yet? Does it
work in an Apple? Apple 2e?
     If anyone has the answers to any of these questions
please mail to me. Post to this newsgroup, too - I'm sure that
this chip is of sufficient general interest.
Doug Collinge.

I just upgrated my //e with the mousetext rom, etc. I am having
problems in CPM though. In Inverse video (i.e. when I run Turbo
Pascal) I see the mousetext characters instead of uppercase
characters. I assume that (for some reason) my Microsoft premium
softcard //e is turning on the mousechars by sending an <ESC> to the
screen.

Does anyone have a fix for this problem? I've tried sending a
control-X to the screen (someone traps it), and have tried to set the
screen mode byte from CPM (but I think I'm doing something wrong when
I try). Nothing has been successful.

-Thanks,--

As I have never read this group please excuse any redundancy.
My sister has just purchased an Apple IIE. She is looking for software
that will allow her to program a form letter and then feed it a file
of records where each record would contain the information to
complete the form for a given customer. The program she has now requires
her to do each letter one at a time. Seems like a good idea huh?

Thanks in advance,

Grego Sanguinetti

I bought an Apple//e and their modem and a super serial card for the
modem. The documents that came with the modem told me how to set up
the ssc. The book says nothing about the the possible settings of the
DIP switches or termination package with the arrow to be pointing to
either medem or printer.

Can any one tell me what the switch settings can buy me? There is
even one labeled as RS-232. Does that mean it is capable of driving
20ma current loop. (I might be able to use my ASR33 after all).

I look foreward with baited breath for any responses.

This weekend I bought a half height Apple 2 compatible drive from the Franklin
company at the Trenton NJ computer show. For $99 it seems fine. So far it
has worked reliably & boots protected disks. According to Franklin it is made
by Mitac, an outfit from Taiwan which also makes Shugart look-alikes for the
Apple.

SInce the half height is so different electrically from the full height
I am a little concerned aboout not having a schematic or maintenance manual.
Can anyone advise me on where to obtain one?

A while back, I asked those in the net.micro.apple community if the
upgrade to Apple Pascal 1.2 was worthwhile. A great many asked me to

pass on information that I received. The following is a summary of the responses to the question. Most of the information came from Dave Seaman (purdue!ags), so if I lie - flame him, not me :-).

The Apple Pascal 1.2 supports the alternate bank of memory on the IIe. The advantages are as follows:

   1) All p-code goes into the alternate bank. Main memory is used for program data and assembly routines. You can run much larger programs without resorting to segmentation.

   2) You can edit large files (<60 blocks).

   3) You can compile large programs without enabling swapping.

   4) You can compile library routines w/o swapping.

   5) Intrinsic units need not be placed in SYSTEM.LIBRARY.

   6) Up to 64 segment numbers are available.

Problems - Dealers say that the deadline for purchasing the upgrade has passed. So, if they are to be believed, you must purchase the entire package ($295 list). One might get around this by talking directly to Apple.

That's all

I am trying to communicate with a 4.2 BSD, and a local version Unix machine with my Apple //e. I have an Apple 80 column card, and a Micromodem //e. The problem is, when I try to use visual on-screen editing, my terminal emulation just doesn't quite cut it. It seems to be a problem with cursor addressing. What I need is a termcap entry that will allow the Unix machine to talk to my Apple. I have been trying to come up with one, but I just can't seem to get it working. There are also problems with inverse video, and other problems associated with bad emulation. If you can help me, please send it to me over the net.

I am in the middle of a book on XLISP 1.4. I hope to include a list of all
the implementations of XLISP 1.4 available. Is there a version on the Apple
//? I would appreciate any information on this.

Dan

==========
I'm having a problem using my Apple IIe as a terminal when dialing in
to a Unix system. I believe the termcap I am using is correct for the
apple IIe with 80-column card, but my apple doesn't seem to respond to
any of the termcap features. The termcap dependent programs like vi
and more don't work properly. I can't even clear screen by echoing ^L,
which normally works when using the 80-column card. I suspect that the
software that I am using is intercepting control characters before they
get to the apple display.

Here is my system configuration:

Terminal: apple IIe with apple 80-col card.

Software: Transend1 communications program.

Modem: Prometheus 1200A (internal) with on-board firmware.
         (installed in slot #2)

Termcap:
     av|apple2e|Apple][e with 80 column card:\
     :am:bc=^H:bs:db#0:bw:cd=^K:ce=^]:cl=^L:dF#0:cm=^^%r%+ %+ :co#80:\
     :cr=^M:dC#0:do=^J:do=^J:ho=^Y:kb=^H:kd=^J:kl=^H:ku=^K:li#24:\
     :ma=^Hh^Jj^Kk:nd=^\:nl=^J^M:dN#0:pt:se=^N:sf=50^W:sg#0:so=^O:\
     :sr=50^V:ta=9999^I:up=^_:

Does anyone have any idea what the problem is?

                  Alan Quan

As far as I know the current version (2.1A) of Kermit
for the Apple is buggy. It does not do 8 bit quoting
correctly and characters are lost (& signs). It does however works
when 8 bit quoting mode is off. (for text files, I did not try
Binary files.)   There is a fix, but I don't know when the next
release will be. (I have it, but you need the source and cross.exe
to use it.)

I'm interested in any comparisons for the various ribbons for the
Imagewriter; are those sold with the Apple label the best, or are there
better ones out there? In particular, are there carbon tape cartridges
instead of ribbons, and can they be used without damage to the Imagewriter
printer heads? Any information would be greatly appreciated.

Thanks in advance...

Can anybody help me with this problem or at least explain what is happening.

I am using the Beagle Bros. program GPLE. When I BLOAD the program,
the disk sometimes bangs. It doesn't always do it, just sometimes.
There doesn't seem to be a pattern. What could cause this?

Also, I once did a BSAVE on screen memory, and when I BLOADed it back
using the same drive it was saved with, it doesn't rattle. When
I use another drive it rattles. Does anybody know what is going on?

Thanks in advance,
Chris Barbay

   Technical Support isn't answering. Is that what they mean by technical support? :-) ... When I try to use the 212a Apple-Cat][for purposes other than communications (i.e., voice/music synthesizers, etc), the modem sends out a carrier (answer mode) tone every time it goes off-hook. However, it does this only when I have the 212a board (with slot-saver configuration) hooked up, but NOT when I'm using the Cat without the 212a board. It seems that the modem is defaulting to answer mode. Could this problem be due to the fact that I'm using a motherboard older than revision 7 (the ones that don't take the lower-case chips, etc)? If not, has anyone had a similar problem, or can anyone suggest a solution?

Hi! I work at Multimate International, developers of MultiMate (A Word
Processing program for the IBM pc. I need any information anybody has about
the internal file format used by both Wordstar and Wordstar 2000. We
are developing some file conversion utilities and the folks at Micropro
are saying, when we ask them for the file format, that it is public
domain info. Well, I don't know where to find it. Can any of you help?
Please send anything you've got.

Thank you,
Davido

     When DOS has trouble reading a diskette after a few
     tries it "re-syncs" the head. It does this by pulling
     the head up against a mechanical stop. Because the
     head motion is an open loop control system (etc.) it
     hits the stop several times causing the banging. The
     underlying cause is that the head alignment is
     different on the drive that made the Beagle Bros. disk
     and your disk.

>
>"Frequently"? I have yet to hear of ONE COMPANY that went out of business and
>blamed software piracy.

Here's one for you: Ray Livingstone (Livingstone Logic Labs) left the Heath
market because his drivers were getting pirated and passed around in Heath
Users' Groups. It was reported in BUSS and H-SCOOP a couple of years ago.
It was a shame, because he was one of the most competent H89 hardware hackers
around.

While of course not all pirates and users of pirated software would have
bought the programs, certainly SOME of them (probably the ones who use the
program as part of their daily repertoire) would have.

And yes, I'm prejudiced because I'm trying to make a living off of selling
my software - and it's not copy protected. Sigh.

     *** Two Comments on Software Piracy and a Response ***
          ++

Date: 1 Feb 85 08:11:21 GMT

Somebody tell me: Is it that much more expensive to develop a program as it is to develop (write songs for) an album, hire musicians, cut the thing, design album jackets, distribute it an what-not? Of course, you don't need to offer software support for an album, but still. Record albums and illegal cassette copies, books and copyright-violating xerox copies, even movies and VCR copies coexist reasonably happily. Whatinthehell is the matter with software?

Russell Reid

==========

Date: 17 Mar 85 08:33:25 GMT

> Of course, the muggers' use of high prices as a rationale for illegal
> copying is, at best, a red herring.

As a rationale, perhaps I can agree. The only rationale I have ever found necessary for piracy is the fact that you get free software. That's a pretty good rationale. But the threat of piracy still doesn't justify the outrageous pricing policies going on today on ALL kinds of software, be it entertainment or applications. If Borland International can sell "Turbo Pascal", which is generally recognized as one of the best Pascal compilers on the market, for $70, what does that make the company that charges almost as much for a simple adventure game?

Ernie Longmire / 311 Don St. SE / Los Lunas, NM 87031-9405
UUCP : {{purdue,cmcl2,ihnp4}!lanl,ucbvax}!unmvax!unm-cvax!cs2532aa

==========

1985.3.19

To answer Russell Reid, nothing is the matter with software. The fact that "record albums and illegal cassette copies ... coexist reasonably happily" does not change the fact that the copies are illegal. Copyright violation is stealing. And stealing is not acceptable! Period. The question is Why is software any different?

To answer Ernie Longmire, the company that charges a high price for an adventure game is called an entrepreneur. No one is forcing you to buy it, and if the company cannot make money, it will go out of business. "Stolen software is free" is not a rationale for stealing, it is a rationalization for making stealing a legitimate practice. The question here is What makes stealing all right? The answer, as above, is nothing.

The increase in stealing of microprocessor software will probably lead to two unhappy results: more expensive software, and more difficult procedures for backup and general personal use. The end result is a more rigid environment all round.

I have very strong feelings about software piracy. The widespread tacit approval of piracy, as evidenced by the number of people I know who own stolen software, simply infuriates me. I don't like shoddy journalism either, and understand why Ernie Longmire criticizes many points of the article in Electronic Games. But he too, is guilty of making incorrect and irrelevant accusations, and in doing so is propagating typical pirate justifications for their behavior.

Here is my letter to all of you with stolen software:

Dear Software Pirate,

I ran Volition Systems for awhile. We sold Modula-2 for the Apple II, IBM PC, and Sage II and IV. None of our software was copy-protected: we figured there are honest people and dishonest people, and copy-protection has little to do with the classification.

I got quite a bit of insight into what it takes to develop, sell, and support software for the masses. It isn't easy. I'd like to discuss a few myths that you people are always telling each other and us (I presume to assuage the guilt that must hit you now and again).

MYTH #1: Software is overpriced

Our prices were nowhere near what you would consider reasonable. The cheapest anyone ever got our system, special discounts and everything, was $245 for a single copy.

I did not get rich doing this. I am now working as a programmer for DEC, instead of a capitalist exploiter of the masses, and make nearly twice what I did at Volition.

But, perhaps we should have sold it for $70/copy like Borland - after all, they have done quite well.

Not as many people want to buy Modula-2 as Pascal, sorry. Also, we hadn't the capital to ramp up production to sell stuff as cheaply, nor could we afford the hefty ad budget Borland has. We would have had to settle for the level of after-purchase support most software purchasers have come to expect, rather than the excellent support we wanted to provide.

We did do some experiments with price reduction. Knocking prices down about 25-40% did, indeed, result in increased business. It barely increased total revenues. It did increase phone support, etc. It can be argued that the price reductions didn't pay off. It is almost certain that further reductions would have been death. We sold a lot of systems, we were making a profit, but were nowhere near paying off the development costs incurred.

Frankly, I shouldn't have to give a shit about what you, personally, think is a fair price. I'm no flaming capitalist, but I must admit that, with few exceptions, price should be related closely to maximizing profit (assuming social costs of production, like pollution, have been factored in), and related distantly, if at all, to cost of development and production.

I can (and will) lower my prices in response to (or to scare off potential) competition, but why lower them (and lower profits) because some guy on the street who has no experience with running a company (which I assume describes you) thinks you are ripping me off? If you think my software is horribly overpriced, why, there's a marketing niche for you to fill. YOU find out what it takes to develop what I'm selling, then let's see what YOU price it at. And don't complain if I change my pricing to put you out of business.

What should matter is this: can I keep my company healthy charging the prices I do? If you think my price is too high, fine, don't buy it; obviously other people find it valuable enough that I don't have to worry about people like you. I should ask myself "If I raised (or lowered) prices by $25, how many less (or more) people would buy my product? Does it change my net profit?" I shouldn't have to ask myself "Well, if I raise my price $25, how many more would-be customers would steal rather than buy?" Hardware manufacturers don't have to take this into account, why should I?

And aside from your obvious willingness to commit theft, I have some severe

doubts about your honesty. Most software pirates I've seen are pathetic liars when it comes to words vs. actions. "I would've bought it if it was reasonably priced" is the constant cry of the accused pirate. Yet I know pirates who don't own a single piece of purchased software, save that which came with the machine. Surely, not ALL software is that overpriced? Most of you people wouldn't buy software unless it was priced slightly higher than a blank disk, and then it would be only to save on the hassle of copying.

MYTH #2: If I can't back up software, I have the right to steal it
---

No, that header really doesn't make much sense to me, either. I don't know why so many pirate arguments complain about lack of backup capabilities in a product. Obviously YOU don't have any problems copying disks. Just get the Locksmith parameters from a friend, or work them out yourself.

(And, well, since you went to all that trouble figuring it out, why not run a few copies off for those guys that gave you Zaxxon and PFSFile last week? I mean, hey, think how cool people will think you are at your next Software Ripoff Club meeting if you bring in copies of stuff they couldn't break.)

Again the analogy to hard, physical products. If my car breaks down, even under warranty, about the only thing I can do is take it in to get fixed. Some companies have better warranties than others, and may give me a loaner. I may take this into account when buying a car. But I have no right to steal a car just because I don't like the company's policy on repairs.

If you don't like the way a software product comes, due to backups, licensing, packaging, or because it runs about as fast as a snail in a coma, don't buy it. If enough people share your views, the company will go out of business or change its policies.

MYTH #3: I wouldn't buy it anyway, so I'm not hurting anyone

I'm sure you think I have no right to come into your house to take items which you aren't using, just as I think you have no right to copy software you "weren't going to buy anyway." In both cases neither of us is hurt, right?

Suppose there was some magic way to stop illegal copying of software overnight. Legitimate purchasers could make backups for themselves, could even loan their software to friends (thus depriving the owner of the use of the software until it was returned). What would the computer software industry be like in this ideal world?

Software pirates would have a hell of a lot less software than they own now. They WOULD own more purchased software than they do now. Estimates of pirated copies range from 5 to 10 times legal copies. Now, I know you just told me you wouldn't have bought any of the software you swiped, but are you really going to do without ANY of it? Assume that legal volume goes up maybe

100%.

Prices would be lower, some perhaps down to 60% of current prices, others only 10%; huge jumps down to the prices pirates think "justifiable" would probably not happen. SOME companies that were marginal would be put on a more solid footing; SOME more good software would make it to the marketplace in quantity. Most software companies run a 5 to 30% return; even a 50% increase in sales is going to affect them pretty heavily.

So enough with your lines about "Oh, c'mon, I'm not putting anyone out of business" or "I'm not the one keeping prices high." You are not the only cause when a software company goes out of business, but your decisions DO have a significant impact.

In Summary

Software pirates are pirates. They steal. No amount of argument changes that. Theft is theft, and bullshit is bullshit, and every argument I've seen to justify piracy falls in the latter catagory. No law gives you no right to decide what constitutes a "fair" price or licensing policy, no matter how well you have justified it "morally" in your pointy little head.

When it comes down to my final opinion, the financial condition of software producers, publishers, and pirates don't concern me nearly as much as the moral question, and the number of people who take the question so lightly.

To steal or not to steal.

Some of you think it's okay. To you, let me wish you the worst of luck. I hope you work your ass off on something that means a lot to you, only to have it ripped off when you've finished. It probably won't teach you anything, but at least you'll have gotten what you deserve.

To those who don't steal software, let me commend you. It is frustrating to watch friends build enormous libraries of software thru illegal means, while yours grows slowly. I suspect your concern for fairness extends beyond the purchase of software, and am glad there are people like you in the world.

The Cider Hard drive has been given a lot of good reviews, I haven't heard of a bad one yet (from 5 or so reviews). It has been given a review in this

months issue if InCider, and I have heard other similar comments from users on bulletin boards in Michigan. It seems that they have put together a good piece of equipment. It can run 4 (or more) operating systems at once, quite a feat for most hard drives. It runs PASCAL, DOS 3.3, ProDOS, CPM and some others which I have forgotten. It can run 24hrs, with no problems, and is small and quite. All in all I've been given the impression that if you need a hard drive, then this is the one to get. (It's cheaper than the DuoDisk)

Hope this has sparked your interest, but for more information, get a copy of this months InCider.

If I understand your request, you want to know how to control
a model from Apple Pascal. There is a modem program written in
Pascal in the book "All About Pascal" published by A.P.P.L.E., a
national Apple users group. I don't recall the details, but
a good portion of the program is concerned with setting pointers
to various hardware locations used for modem control. An alternate
approach would be to add a device driver to the BIOS. The same
things would still have to be done in the BIOS, but at least then
it would be mostly transparent to the user program.

I just received a letter from Sir-Tech answering my questions about Wizardry, and they recommended me to stay away from the program WIZARD'S WORKBENCH, stating that it could ruin the Wizardry disk, and its use would void the warranty.
Has anybody used this program extensively? Does it really ruin the master disk? Any comments would be appreciated.

On another note, In Wizardry III, if your good party chooses to fight when they come upon the "Fight or Leave in peace" situtation, they could turn into Evil characters as Fighting is an Evil trait. Beware! for now a party can contain all three alignments at once, causing interesting results.

Happy adventuring.

Relative to the 80-column character loss with high baud rates on the
Apple as a terminal ....

It was revealed by Jim Hayes that the problems was not in the SSC
interface, but rather the 80-column firmware that handles scrolling,
and thus loses beginning characters. He recommended a hardware
scrolling card made by Computer Stop, near Hawthorne, CA., which
worked much faster.

This card was for the][and][+ only; it is *NOT* compatible with the
//e. For this reason, it is no longer in production, but they do have
a few cards left. It was one of the very early 80-col. cards, and was
called the Omni-(something). The number is (213) 214-1501.

    Does anyone know of a card for the Apple IIe that gives it MS-DOS
compatiblity. Supposedly one exists.
    (The equivalent of the Quadlink that makes a PC Apple compatible)

Info wanted is who makes it and how much it costs.

Mail me (preferred), or post to .pc (I already have a PC, this is for a friend.)
Thanks

Well, I knew if I waited long enough, it was bound to surface! The April 1985 issue of InCider magazine contains a list of undocumented 6502 op codes. The article is located in the Apple Clinic column of the magazine. These op codes are for the Synertek 6502; they may not be applicable to other manufacturers chips.

Note that when you pick this up, instruction $12 does not cause the HCF (halt and catch fire) operation. This, and many other undocumented functions $?2 range are described as "a five cycle instruction which ends with the processor hung at $FFFF; the 6502 must be reset to escape this condition". For that matter, stick your fingers (after grounding) to any of the chips in your Apple after it has been running awhile. They'll probably be rather hot. The HCF is an old "funny op code" from a list of these that was old when I first saw it (> 7 years ago). If anyone wants a list of these, mail me; if enough response, I'll post my list of silly op codes.

Surely you didn't beleive that some software instruction would set a chip on fire ??? :-)

[.....]

Of similar interest, here is a letter found in the mail section of
Unix World, Oct. 84:

Gentlemen:

The feature article "Software Security and the Pin-Striped Pirate," in
the March/April 1984 isisue of UNIX/WORLD was well thought out and
useful. Unfortunately when Mr. Auditore cam to economic analysis,
he merely parroted vendors' claims, which have all teh sophistication
and economic insight of a sales representative calculating the commission.
A more thorough analysis is needed.

One may easily observe: (a) Unsupported (pilfered) copies of commercial
software represent a competeitive force (arguably an unfair one) to
keep prices down. If Context, Lotus, Microsoft, and Sorcim all
announced the withdrawl of their spreadsheet products from the
market and a recall of all copies previously sold, would VisiCorp
respond by selling VisiCalc at $50? (b) The widespread use of unsupported
(including pilfered) software is indicative of how highly the marketplace
values the support currently offered by vendors. One can compare this
to the proliferation of "no-frills" stock brokers, "you-bag-it" grocery
stores, and "self-serve" gas stations. (This should not be taken as
equating the legal status of any of these to pilfered software.)
Only as it becomes uneconomic to pilfer software will it cease.
Do moral preachments and draconian threats have a good track record?

From a sociological perspective, most people whom I have observed
as having any appreciable quantity of unsupported (including pilfered)
software generally have vast heaps of it and never use more than
even a small portion. Others use pilfered software as a result
(they say) of bad experiences with the deplorable quality of software
which they legitimately purchased. Paying several hundred dollars
for a highly touted product to discover that a far less expensive
has far greater functionality can reduce one's good will toward all
manufacturers. One could also easily claim that no company with more
than 10 employees should even pretend that it supports the microcomputer
user (MicroAm and GerundiveStar). I should also note a most
penetrating and provocative analysis of copyright at the end of
"Sony Versus Universal Studies: So What?" in PC Tech Journal, 1:8
(May 1984) pp. 197-201.

Thank you,

Ross Parlette, Bldg. 0010
computer systems specialist
United Technologies Chemical Systems
P.O. Box 50015
San Jose, CA 95150-0015

(408) 779-9121

Authors response:

The perception that software theft is a positive competitive market force is similar to thinking that shoplifting from a department store is helping to keep prices down. Major retail outlets allocate 2-3 percent of the sales total to "lost" merchandise. Clearly they don't accept 2-3 percent less profit. To insure that this percentage does not hit their bottom line, it is added into the price of all products being sold. The software business is much the same. Instead of Mr. Parlette's utopia, where software pirates are keeping software prices down, what we have is the rest of us supporting these Brooks Brothers buccaneers by having the losses attributed to piracy added to the price of our legitimate purchases.

Regarding the value of vendor-offered support, it is important to remember that the software vendor decides what the product is and how much he thinks it's worth. If you don't agree with the vendor's valuation, you don't have to buy it. But one of the options upon disagreement of valuation is not the right to steal it. Certainly a case can be made for "no-frills" software, similar to a self-serve gas station, but remember, you still pay for the gas.

Software piracy is just as much a crime as is shoplifting a pair of Calvin Klein jeans from Macy's. However, because of our inability to fully comprehend the concept of intellectual property, there is no social stigma attatched to the rape and pillage of a software program. Instead the hackers that rip us all off are condescended to: "My, how bright! Isn't that clever?" Indeed. Just as clever as the people who engineered the Brinks robbery or the thugs who robbed the local 7-11 store.

- Steve Auditore

Keith Doyle
{ucbvax,ihnp4,decvax}!trwrb!cadovax!keithd

P.S. I wonder how Steve figures you can know whether or not you agree with the vendor's valuation of his software if you haven't ALREADY bought it.

Personally, what I object to most, is the fact that if I upgrade my computer system to new and better hardware, I have to throw my old software away. After you've bought that same spreadsheet or compiler or whatever enough times, you really begin to wonder what you're getting for your money.

Back in January (or so), I posted an inquiry about the availability
of the original Crowther/Woods Adventure game for the Apple][.
Many people responded helpfully, and many others wanted to know
about it. The following is a summary of the helpful responses.
I've effaced phone numbers and personal mailing addresses, but not
Usenet addresses. If if you want to contact one of these helpful
people, do it through electronic mail, don't bug them on the phone.

One note: I've heard a rumor that the Microsoft Adventure is no longer
sold. Since I was carrying out this whole survey on behalf of a friend,
I haven't investigated this directly.

From: decvax!seismo!ut-sally!usl!rww (Robert W. Walsh)

    I have a copy. It was translated into assembly from the original fortran
but it is complete in every way. You can either call me up directly or you
can send me a disk. Write me and tell me how you would like it.

Two tangential issues, explaining SOME piracy, but NOT justifying it:

(1) Many pirates are just packrats. They don't use the stuff half the
stuff they have , but keep it around "just in case." Sure, they'd have
to buy programs they *DO* use, but as the cost goes up, the perceived
benefit must increase as well.

(2) A significant amount of software does not do the job as
advertised. Maybe it's buggy, has size limitations, undecipherable, or
the ads lie. I am much less inclined to buy *ANY* package over $50
unless I have strong reasons to believe it will work in my situation.
Few vendors will accept a return on the grounds that "it didn't do what

I wanted." Perhaps some piracy starts as a test-drive. It certainly takes great moral strength to then pay for something you've gotten for free.

Summary:

I applaud Joel's article. I would like to offer a few thoughts of my own, some of which may duplicate Joel's. If so, my apologies in advance.

I was introduced to computers in high school, with all that implies. I learned assembly language on the Apple][and IBM PC by "breaking" (i.e. removing) the copy-protection on a wide variety of software. I did not then own a computer of my own, but my friends thought what I did was wonderful.

Later on, two things happened:

1) Congress passed the Computer Software Copyright Act.
2) I started thinking about what I was actually doing.
   This was prompted by my entry into the field as a
   person trying to *sell* programs to make (at least part of)
   a living.

It's amazing the perspective you gain when it's YOUR program being copied. I have had to discontinue at least one product because of outright theft. We're not talking living-room copying after the computer club meeting; we're talking taking someone else's program, changing it slightly, and selling it to the same market for a ridiculous price. It hurts, in more ways than one.

I have heard many excuses for pirating software; one of my friends is an avid "collector". Most of the disks he has have been used exactly once (to "make sure it works"). Here are some that Joel didn't mention:

"It's only a video game..."

> Most video games worth playing (and thus pirating) are the most sophisticated pieces of software on the market. There's a lot more programming expertise in, say, "Wizardry" than there is in an average accounting system. Think about it: real-time graphics, keeping track of input from multiple sources, etc. Especially on the Apple, getting graphics good enough to give your program an edge in the market is like squeezing blood from a turnip, and gives new meaning to the word "optimization". Every compiler designer should be forced to write a commercially successful video game. But I digress...

"No one will ever know it was me..."

> Possibly so. Would you steal a book (or photocopy the whole thing) for the same reason? Maybe so, but probably not.

The fundamental problem with software piracy is that, while being theft of intellectual property, it bears a very strong resemblence to making backups, which is a very good idea indeed. Pirating doesn't "feel" like a crime. There is, however, no fine line here. It is very simple. Let's say you have a copy of a piece of software. If you own an original through legal means (like buying it), it's a backup. If not, it is a pirated copy.

Think about it, and pretend for a moment that it's YOUR software being pirated.

Some articles posted on the net have contained several misconceptions
that should be cleared up:

1) No program has been severely hurt by software theft, and no company has
   gone undef because of it.

   I hope that the recent articles posted to the net clear this up. There
   are lots of program. And remember, any progam that fails would have
   lasted longer without theft. It's true that lots of things fail from
   bad management - but "bad" management is defined as management that isn't
   good enough to survive under the circumstances. Well widespread theft
   is one of those circumstances that should't be there.

   I myself have essentially left the low-end commodore market because my
   programs (even though they sell for $50) are extensively pirated.

2) If Borland can sell Turbo Pascal for $50 why does other software cost more?

   Remember that Borland is an exception and is currently one-of-a-kind in
   the industry. Every other company that tried $50 software in the
   higher-end markets has died. Borland operates on slim margins with a
   huge advertising budget. It's not the thing a startup can duplicate.

3) Turbo Pascal isn't copy protected

   I've spoken with Philipe Kahn about this personally. This program is
   "copy protected" by a cleverly designed manual that's the wrong size
   and the wrong binding for photocopying.

4) Most software theives wouldn't buy it so a sale isn't lost

   That may be true for some theft, but not in my case. Some of my products
   include system programs like an assembler and other programming tools.
   They are widely stolen, because they are in demand among programmers
   and hobbyists, the people that are the biggest theives (sad to say).
   They only cost $50 and one isn't copy protected. But they are stolen like
   crazy. And the theives are using them, not keeping them on the shelf.
   If you're using a $50 product, you should have paid for it.
   I've even had people come up and complimented me on the products
   when it's clear they stole it.

5) Software is like books, and the book industry survives

   Software is copied perfectly on a disk. You get a copy every bit as
   good as the original. Not so for books and a photocopier. And copying
   a book is a lot of work, and often involves destroying the binding of
   the original.

Although the article I'm replying to was well-reasoned and contained a lack
of emotionality that other posters should emulate (hint, hint), it seems
to me that there are two questions going unanswered (for me, at least):

1) Does pirating occur to such (or any) degree on larger (non-micro) systems,
   or with systems owned by companies doing a reputable business ?

I don't think so. For the mainframe case, it matters a lot that the soft-
ware works. I suspect any random user can log on & complain about
software not working, and expect to get a response of "we'll fix it", as
opposed to "it's a bootleg, so forget it!". If one does get the "bootleg"
response, a large system would quickly lose customers / be reported.
In any case, the thought of a system manager going out & swapping f77 for
rogue (or whatever) at the nearby hacker meet seems ludicrous.

The same kind of propriety probably forces businesses to buy micro software
as opposed to pirating it. I think that this situation is more likely
to cause pirating than the mainframe case, though.

2) Why doesn't the book industry die due to the ease of photocopying ?

I think there are at least 3 reasons :
  1) Photocopying is harder than disk duplication.
  2) Books are nice in their own form, while a binder fulla photos is
     not so pleasant.
  3) Buying a dozen copies of a book doesn't cost 12 * $600, more like
     12 * $40,   or $7200 vs $480. Now admittedly, it may be hard to sell
     a little bit of software for $40 per copy and make a profit,
     due to disk costs, etc... but I think that more than $10 for production
     costs is silly. (I don't know the hard facts on software prod'n though).

     In fact, I have a war game published by a large general-software

publisher, and they sell public domain games for $7.95 for about 8 or so atari games, $5.95 for p.d. PC software, and $3.95 for Apple stuff. They aren't a charity, so they make some money at this, I'm sure.

Basically, the costs for software are not the cost of copying and distribution, but in the large front-end cost of creating the program to start with. It is a mistake, I think, to go into the software business by starting a company, writing one program, then go beating the streets with your one software product in the hopes of making a million.

Imagine what would happen if you tried to do the same thing in the book business. You would NOT get away with writing your book, starting a publishing firm, and then going bookstore to bookstore to get orders of 50 copies here, 30 copies there at $299 each!!!! For starters, no bank/whatever would finance you.

A lot of people think that getting into the software game is the same as starting a company. I disagree. It is the same as getting into the book-writing business. First, you write a rough draught, take it to publishers, get their interest, then you polish & edit, and hopefully, they publish you. You then sit back & collect 15% royalty and live like a king (or peasant, depending on sales :-).

If your program is going to sell, it will have a MUCH better chance in the hands of an ok publisher than it does in your hands. Why ? Because selling software & writing software are not mutually inclusive. The world's best hacker probably doesn't know sh*t about how to mail-proof diskettes, and he probably doesn't know how to manage a company, either. So why take the risk ?

Now that I have really dug myself in deep, I'll try to get to the point. One thing that people miss is that software always needs documentation. I used to bootleg programs on my Apple, but I soon stopped when I realized that I was filling up perfectly good disks with programs I'd never use and that I had no idea how to use properly in the first place. It soon hit me that I would have to rip off documentation, as well. So now I have only half my disks with useless crap on them, plus a bookshelf full of various binders with documentation that doesn't match the software & isn't complete, all in lousy photocopy.

The good software publisher also sends a good book along with the disk, and to me, it's the book that you really need. The software is probably useless without the documentation, anyway. If you're a really determined thief, you'll steal both the software and the disk. On the other hand, such theives are not so prevalent, since there's no challenge to photocopying, just work. And since you're paying $40-60 for a book, do you think a looseleaf binder with lousy photocopies of a badly-organized manual is acceptable ? Not likely. More likely you want to pay $40-60 for a well-bound paperback, at the very least, and a hardcover as a bonus !!

> What is needed in the software biz is the realization that happens to all booming but maturing businesses. There will be no more of the old days, and not quite so many young pioneers in the biz that there used to be. From now on (+ 2-4 years) there will be no more one-product software houses that make a small killing. Just as there will be no more huge 1-product car companies, or huge 1-product mainframe makers. There will only be the Borland's of this world, who will make either a large killing or die in the price competition.
>
> This isn't say that software writing won't be done anymore, just not the same way. Prices will come down due to real competition, and pirating will stop because there is no more need of it.

I welcome any comment on this, but please, no emotionalism,
Thank-you

One myth you forgot about is the one that says "Well geewhiz, I mean things like books and records and movies aren't copy-protected and those folks manage to get rich. The same should apply to software."

This is one of the rationales that people like Jerry Pournelle use to argue with software developers. The difference here is quantitative (you know, numbers and stuff) rather than qualitative (motherhood, patriotism, solar energy for the masses). How many people can read? How many can get to a theater? How many have access to a record player? Now..... how many people have computers?

Every business in the world that plans on being here for more than a couple of days has to have information on the market for which his

products are intended. He needs to apply this information in his overall retailing strategy. And this includes the price he must charge for those products. Right now *ALL* computer software is distributed to a vertical market because, let's face it, the average consumer does *NOT* own a computer.

That's all,

Frank

Summary:

There are also two other ways around this problem. The first is to just drop a serial com. card (from Apple) into slot #2. The P-System will recognize it and call it REMIN: and REMOUT: Just read and write the date from these units. P-System takes care of the rest.

All About Pascal from Call Apple does indeed have a Micromodem II compatable program for telecommunications, but then again, it's nothing like P-Term -- ie the Z-term of the Pascal-World. If you just want to talk to a serial card, why don't you just simply peek and poke memory locations in varient records, or if you must, you can use assemly language and link it to the host.

I suspect that Sir-Tech doesn't want you to use WIZARD'S WORKBENCH in general because it allows people to create their OWN Wizardry scenarios, thus cutting down on the market for Sir-Tech developed ones. I have seen the program but have not used it. It will only "ruin" your master disk in the sense that it will alter the data on it and if you don't know what you're doing it could mess things up a bit. Just don't alter your original Scenario Master. (It's a good idea to never even PLAY off of the original of the SM, because the shopkeeper keeps totals for the whole disk, and rare items hauled in by earlier parties would be in his shop already. Ik! Also, what if something goes *munch*?)

Anyway, just back up your SM before you edit it with WW. WW is quite impressive, as is its counterpart, "Exodus Construction Set".

By the way, to the "No Cheating!" freaks, I do not believe that WW allows you to edit the characteristics of active players. But if you can turn Werdna into a lousy Orc, who needs to?

Not only do books photocopy terribly, who would pay 5 to 10 cents per page
for these terrible copies.A four hundred page book even with 2 pages xeroxed
on one sheet still costs ~ $20.

Apple Pascal has a prompt for a debugger, but no debugger. Does anyone have,

or know of a debugger for Apple Pascal? I'm running into errors that are becoming increasingly obscure; I sure could use ITS or sdb about now.

Any pointers appreciated.

There's not really a "right" newsgroup for this question, so I'm posting it to several. It's a personal computer question, and I'm hoping that some of the readers of this newsgroup might just be able to help. . .

Recently, Coleco announced that they were dumping the ADAM personal computer. Since then, the system has become available at some large discount toy stores at extremely attractive prices. (i.e. < $300.00). As I am a collector of personal computers, this has picqued my interest. However, I know next to nothing about ADAM, and would like to have the input of some people who do know about it.

Specifically, what sort of software is available? Is it any good? Is the "built-in" word processing software any good? The box says ADAM BASIC is "source code compatible" with AppleSoft BASIC -- can I take that literally? The box mentioned an optional disk drive as a future -- did that ever come to pass? What about the price? Can I reasonably expect it to come down any further, after the "liquidator" has recovered their investment? How readily available are they? Have you seen many of them lying about? (I'm concerned that the supply might dwindle before I've made my decision.)

Also, I am a hardware hacker, and would be curious to learn what I can about the innards of this beast. In particular, how difficult might it be to get

ADAM to talk to my other machines (e.g.: Atari, Commodore, DEC)?

To re-iterate: I know NOTHING about ADAM, and so ANY information AT ALL would be greatly appreciated. (Even if it might seem like a trivial comment.) Also, pointers to good resources for further research would be appreciated. (i.e.: Is there a magazine that addresses the ADAM? Any reliable mail-order sources for software/hardware?)

Since I don't monitor all of the newsgroups to which I'm posting this, Email to would be preferable. I'll gladly summarize what I learn and post it here.

Many thanks,

 Kevin Crean

Summary:

I am attempting to develop some software for the Apple II line and have run into a problem with the Apple IIe. My software uses the goto-x-y cursor addressing string extensively (^^xy) to move around

th screen.
    Although it works fine on the II+ (and compatibles) with several types of 80-column card, it doesn't work on the IIe. When it tries to go to a screen location on the IIe, it sometimes moves the cursor to the right place, and sometimes moves it to a location that is off by one row.
    Since I don't have a IIe myself, I am having a hard time figuring out what's going on. I've checked the IIe 80-column manual & have found little inspiration. Incidentally, I'm using the "pascal entry point" at $c9aa to talk to the card. Anybody got any help to offer? Please?
    In addition, I have found that on carriage return, the IIe and the II+ do not behave consistently. In particular, if the 8th bit in on, the IIe emits a line feed while the II+ does not. If the 8th bit is off, the IIe ignores the carriage return (prints a "M") while the II+ does a return and line feed. What a pain!

Hi All. My name is DOCTOR VAX and as a PIRATE I would like to answer some of the STUPID statements of Joel McCormack.....

  I have read his letter many times and still see the same thing. He had[has] a company that sold a fairly expensive product. This is not bad in itself,but his product was SHIT!!! Take it from me I know. He acknowledges that he didn't have the capital to ramp up production. Well Joel it takes money to make it. You obviously didn't and tried to SNEAK by with a product that YOU thought would make it. Bad business JOEL !! You also tried to recoop your development cost to soon. Bad move again. Then you started discounting with big numbers. Tcchh Tccch.... Bad again. When that happens most intelligent people [dealers to] see the writing on the wall. Jeez did you ever take a Business or marketing cost??? You also stated that you didn't give a shit about what we think is a

fair price. That's true for me, but what about the people out there that want to buy it. Your software was just overpriced and not that GOOD [ouch!]

About MYTH #2

I DO have the RIGH{ to back up MY software. Look into the Laws you jerk. Your anlogies to the car holds no water. If my car breaks down my business will not suffer. Without a backup it will!!! You also stated that if I[we] don't like theway software is packaged,licensed etc then don't buy it. Well thats what we did and thats why your working for DEC [ouch that hurt]. By virtue of you now working for dec means one of two thing. You talk good shit and got or job or you are a good programmer. I hope its the latter. A good businessman your not.

About MYTH #3

The estimates of 5-10 times the legal copies is just that. An estimate. Prices would not come down as much as you think. The people that are still in business like Broderbund,PFS,Quark,Penguin etc have low prices already. The software is selling good too. Not because its cheap,but because its GOOD. The best example is BEAGLE BROS. utilites for the Apple. NEVER has ANY of there software been protected!!!!!! They're doing just fine. Ask Bert.

I have around 500 disks worth of software [not yours I deleted it] and some I bought and most I got. Also your statement most pirates are pathetic liars is a bunch of bullshit!!! You must know some shit people [birds of a feather... All of the Pirates I know are ok people. We don't hurt any company. If your software is good it'll sell if not well.....

So in Summary it sounds like your just a pissed off [on] businessman and looking for a SCAPEGOAT. As for the MORALITY of it YOUR FULL OF SHIT!!!!!!!!!!!!!

I DIDN'T BRING DOWN YOUR BUSINESS-----YOU DID. YOU DIDN'T KNOW HOW TO RUN IT
YOUR AN ASSHOLE. YOU FAILED AND CAN'T ADMIT IT!!!
IF AND WHEN YOU HAVE SOME GOOD SOFTWARE LET ME KNOW. I'D LIKE TO SIGN IT

DOCTOR VAX LATER!!!!!!!!!!!!!

Summary: Let's look for positive solutions.

Rather than demeaning ourselves & destroying our personal integrity by
stealing the stuff, let's find a positive solutions to the challenge.
I like the one practiced by Borlund. They saw a market & filled it
with a product that does its job at a price anyone can afford.

>Of similar interest, here is a letter found in the mail section of
>Unix World, Oct. 84:
>
>...vendors' claims ... have all the sophistication
>and economic insight of a sales representative calculating a commission.
>A more thorough analysis is needed.

You bet it is, & the combined smarts of the people who created
the system (that's us, folks) can find creative solutions to
anything we want to find solutions for. If we don't, it's just
because we don't choose to.

>...Only as it becomes uneconomic to pilfer software will it cease.
>Do moral preachments and draconian threats have a good track record?...

This is the real cruncher. We have no business trying to stop people
from doing whatever they choose to do, but we can make it easier to buy
than to steal.

>Others use pilfered software as a result
>(they say) of bad experiences with the deplorable quality of software
>which they legitimately purchased. Paying several hundred dollars
>for a highly touted product to discover that a far less expensive
>has far greater functionality can reduce one's good will toward all
>manufacturers.

Clearly, the answer here is to encourage software vendors to price
their products competitively & to offer user support. How do we do
that? With our pocketbooks. Buy only from companies that support us.
Another powerful tool is reverse engineering. If the only companies
that offer a product price it too high, that leaves a market slot for
someone else to take advantage of (a la Borlund).

>Authors response:
>
>...what we have is the rest of us supporting these Brooks Brothers
>buccaneers by having the losses attributed to piracy added to the
>price of our legitimate purchases.

This is only half the cost & it is far too high. The rest of the cost
is loss of our own self-esteem (that's right, you are too inadequate
to ever be able to get that software honestly. You had to steal it.
Even if you had the money, you aren't worth having it honestly; you
don't deserve to have it.)

>Regarding the value of vendor-offered support, it is important to remember
>that the software vendor decides what the product is and how much he thinks
>it's worth. If you don't agree with the vendor's valuation, you don't
>have to buy it. But one of the options upon disagreement of valuation is
>not the right to steal it. Certainly a case can be made for "no-frills"
>software, similar to a self-serve gas station, but remember, you still
>pay for the gas.

An example of a positive solution here is the myriad of companies
offerring dBase classes & pre-processors. The same solution is
available to all other software markets.

>Software piracy is just as much a crime as is shoplifting a pair of
>Calvin Klein jeans from Macy's. However, because of our inability to
>fully comprehend the concept of intellectual property, there is no
>social stigma attatched to the rape and pillage of a software program.
>Instead the hackers that rip us all off are condescended to: "My, how
>bright! Isn't that clever?" Indeed. Just as clever as the people
>who engineered the Brinks robbery or the thugs who robbed the local
>7-11 store.
>
>- Steve Auditore

Steve hits the nail right on the head; the highest cost of software
piracy is the destructive effects of our attitudes about it.

In article <485@cadovax.UUCP> keithd@cadovax.UUCP (Keith Doyle) writes:
>P.S. I wonder how Steve figures you can know whether or not you agree
>with the vendor's valuation of his software if you haven't ALREADY
>bought it.

I agree with Keith's complaint about valuation, so let's encourage (by
shopping at) stores that offer in-store (& at-home) testing of
software packages.

>Personally, what I object to most, is the fact that if I upgrade my
>computer system to new and better hardware, I have to throw my old
>software away. After you've bought that same spreadsheet or compiler
>or whatever enough times, you really begin to wonder what you're getting
>for your money.

I agree with Keith's complaint about upgrading our computer systems,
so let's encourage companies to develop upgrade & enhancement policies

that will let us return our existing software for the comparable
product for our new system. Realize that the company will have to
charge an upgrade fee. Be willing to pay it while we encourage the
company to keep it reasonable.

Sorry for rambling on so long, but this seems important enough to
warrant it.

> his product was SHIT!!! Take it from me I know. He acknowledges that he didn't

     The issue here DOCTOR VAX, is not how good or bad a product is, but
what software pirating is doing to the computer software industry. By now,
I am sure that you have recieved the personal response which I have sent you.
You would be well advised to read it, probably several times.

     The fact remains that it is ILLEGAL to copy programs and distribute
them to anyone, whether free of charge or not, if they are registered with
the library of congress and protected under the copyright laws of the

United States.

I applaud Lotus Development Corporation in their attempts to crack down on software piracy. To date I am aware that they have stopped at least two major software pirates. One of the software pirates was distribuing free copies of 1-2-3 among nursing homes. His piracy cost the firm which owned the nursing homes something like $1,000,000. The other piracy case was resolved for a similar sum of money.

> I DIDN'T BRING DOWN YOUR BUSINESS-----YOU DID. YOU DIDN'T KNOW HOW TO RUN IT

> IF AND WHEN YOU HAVE SOME GOOD SOFTWARE LET ME KNOW. I'D LIKE TO SIGN IT
>
>
> DOCTOR VAX LATER!!!!!!!!!!!!!

DOCTOR VAX, did you know that the above statement could cost you a lot of money? Calling, or even implying, that someone is an ASSHOLE could be subject to litigation. If the person whom you have directed the comment to feels that he has been defamed, he could sue you for actual and punitive damages.

In the future, DOCTOR VAX, I suggest that you keep a civilized tongue. Not only may you have just damaged the reputation of the one whom you have directed your comments to, you may very well have damaged the reputation of the company you represent. It is DEC Engineering Network, isn't it? How about the bad image you have just given DEC itself?

I've recently run into a screen formatting problem using the shell
libraries for Aztec C65. Specifically, my //e (I don't know if this
applies to //'s and //+'s) can control the location of the scrollable
window by poking into memory locations 34&35. This does not seem to
be supported by the kb_ctl command which duplicates the Apple calls
to clear the screen or clear a line or home the cursor, etc. If I
directly change the memory locations 34&35 in a C program by assigning
appropriate values to a pointer, the assignment works but the shell
immediately changes the values back to the defaults. This problem

does not occur if I'm working with stand-alone libraries so the shell
must be the culprit. Does anyone know how to get around this problem
or have a copy of the shell source code?

Thanks to an agreement with Borland, Turbo Pascal is sold on this campus
for a ridiculously low price (about $30 or less, which is WAY below the
already modest price of this package). Result? Students are stealing
copies. I've become so hardnosed I won't help anyone who doesn't have a
manual. What does this say about the widely-heard theory that piracy
exists because software is low-quality or overpriced? (Aside: students
have told me that their instructors have told them not to bother buying
the package! I find it amusing that universities are way behind the
business community in standards of ethics...)

Wouldn't this tone be better off in net.flame?

> his product was SHIT!!! Take it from me I know. He acknowledges that he didn't
I think this is uncalled for. Whether or not the product was worth
anything at all, it is not nececssary to publicly insult Joel and/or
his work. I see you have asked us to belive you but you have cited no
specifics as to *why* his product 'was SHIT', nor have you given us
any reason to accept your credibility.

> I DO have the RIGH{ to back up MY software. Look into the Laws you jerk......
  ....
> did and thats why your working for DEC [ouch that hurt]. By virtue of you
> now working for dec means one of two thing. You talk good shit and got or
> job or you
> are a good programmer. I hope its the latter. A good businessman your not.

I don't see how this has any revelant bearing on the subject being
discussed. I infer from your 'ouch that hurt' that you have a rather
low opinion of DEC, yet you call yourself 'Doctor VAX'.

> I have around 500 disks worth of software [not yours I deleted it] and some

And I bet you use it all, every day. Let's see, 500 disks at about $5
a pop...that's about $2500 you have invested in an inert software
library. I can see a real need for about 15 or 20 text editors, 5 or
6 spreadsheets, etc., and I'll bet you just have shelves and shelves
of the documentation that makes it useful at all.

> So in Summary it sounds like your just a pissed off [on] businessman
> and looking for a SCAPEGOAT. As for the MORALITY of it YOUR FULL OF SHIT!!!!!
>
> I DIDN'T BRING DOWN YOUR BUSINESS-----YOU DID. YOU DIDN'T KNOW HOW TO RUN IT
>   YOUR AN ASSHOLE. YOU FAILED AND CAN'T ADMIT IT!!!
> IF AND WHEN YOU HAVE SOME GOOD SOFTWARE LET ME KNOW. I'D LIKE TO SIGN IT

Somehow I get the feeling that you've never read net.announce. This
kind of writing is extreme even for net.flame. Just ask Ken Arndt.

I'm sorry if this response sounds like the picky kind of flaming that
goes on periodically about spelling, english, grammer, etc. but this
person really rubs me the wrong way. I've been reading the net for
about 6 months, and I have yet to see a letter as openly insulting and
pointless as this one outside of net.flame.

Dear Dr. Vax:

Suggestion #1: learn how to read. Suggestion # 2: learn how to write.

I never blamed software pirates for putting Volition out of business.
(Volition still is in business. It is bankrupt, but that was caused by
infighting among stockholders, not by external business practices.)

We had a lot of customers who not only BOUGHT our "overpriced" software, but
wrote or called to tell us how much they liked it. Lowering our prices
brought in more money and orders; I was simply making the point that more
orders does not mean more profit. And profit margins at $70 a copy are
pretty slim. I also stated that I should worry about my prices in terms of
honest buyers, but should not have to worry about thiefs when setting prices.

Being intimately aquainted with copyright law and its relevance to
computers, I never stated you have no right to back up software. (Actually,
depending on how you purchased your software, you really might not have such
a right.) Volition did not "license" your use of an object copy, it sold
the copy and included a little notice of your rights under copyright law.
This included making backups, and selling your copy (in which case you
should either also transfer ownership of the backups, or destroy them.)
In any case, however, you have no right to own or backup any stolen software.

(By the way, I talk good shit AND am a good programmer. What a combo!)

Lots of people still in business charge very high prices. The value of the
software to the purchaser is what counts: if an honest purchaser sees that a
$2000 piece of software will save him $4000 in a year, he is likely to buy a
copy. It doesn't really matter if it took the programmer 45 (very productive)
minutes or 3 years to write the program. If it is the only thing available,
and cost-effective, it makes sense to buy it.

You stated you have 500 disks of software, most of which is stolen. How
badly would you be hurt if I came and stole it back, and magically prevented
you from replacing it? Would you do without ALL of it? Would you get other
programs that perform a similar function?

There are plenty of stupid things I will admit to, but bringing down
Volition is not one of them. Neither did I blame pirates. I simply said
there is no moral justification whatsoever for pirating. You have yet to
tell me convincingly why I should change that position.

And why should I listen to someone who will rant and rave for a page, yet
not even give their name? If you are doing nothing wrong, why not admit who
you are?

- Joel

P.S. to the world.

I have gotten several private responses about software piracy, and will
summarize them when the flow seems to stop. The general feeling, aside from
the anonymous "DOCTOR VAX" is that piracy is indeed illegal, immoral, and
has resulted in companies and products disappearing (or not appearing).
I have been replying to people privately; Dr. Vax would get the same
treatment but for lack of a valid signature.

Well, after having a pirated copy for a few weeks, I went out and
bought an original Appleworks. What a Great program. I recomend it

to anyone wanting more that just a word processor.

I have some questions regarding the disk catalog of saved text.
When I do a cat command, my word-pro files (thats all I can vouch for
right now) come up with a file type of ...   ADB what caused this?
do I have a bad copy???

Thanks,

Andrew Rahme.

I just checked out Appleworks again to see what the other files were,
but my disk with my work-report (only) now catalogs as .. AWP
which is what I expected, but last Fri it said ADB but would load in
as a word pro file. Help, Whats going on??????????????????????????

Andrew.

Actually, you don't have to ** register ** the program to have
copyright protection. If you write a program, and include the
required copyright notices, the program is copyrighted, whether
or not it is registered. Potential penalties differ, however,
depending on whether the program (or any other copyrightable
material) is registered or not.

I'm not sure of the exact details for the copyright notices or the
differences in penalties, but could find out the ** basics ** if
people are interested, and there's nobody in NETland that does
know.

This followup should really be in the mail, but my site has
recently been returning all my mail ...so...

There is a book by Steven Frankel on the various cards availble for
the Apple II and the CP/M system in general.(The compleat book on CP/M
for Apple...this isn't the exact title as I lent out the book and
am only sure about the weird spelling of 'compleat').

Another good summary was provided by in Byte, Dec. 1984.

As a games user and as author and distributer of Bridge and Cribbage for the IBM PC some comments on piracy..

1) The sale of copy protected diskettes should be outlawed. In the case of games such as Zork II the cost of replacements now exceeds my original purchase price. Worse the turn around time on replacements would be bad enough even if Infocom wasn't inclined to send back bad diskettes claiming that nothing was wrong with them.. I sent back a letter including the "Dead Parrot Sketch" and described in vivid detail the scratch across the disk and the inability of the platten to rotate within its jacket but this I suspect only invited longer delays.
   I have also purchased for $100 a macro assembler that was copy protected. Since it took over 3 months to obtain this product I subsequently decided that developing software on the atari with such liabilities would be suicidal...
2) Piracy is a problem but copy protecting diskettes is not going to defend companies from those individuals who could hurt sales via pirating software (actually for individuals read companies). So why copy protect diskettes.
3) My own solution to this problem is I think sufficient, and I would be interested to know if others agree. Firstly, the distributer rather than the user should be considered guilty of piracy... Frankly, who is not going to use what they are given, and who is to say that the user necessarily knows that the item is pirated. So (using sophisticated software protection) put an identifying serial number on each diskette, and add to the copyright, a notice offering a reward to information leading to the conviction of copyright violaters and include a telephone number. Distributers cannot assume that distributed software stays in the hands of trusted friends, and so this becomes a real threat and liability to them. It only remains to ensure that courts provide strong protection for developers, and in particular make it worth the developers while to prosecute any and all violations... In Datamation one gross case of video piracy resulted in a 10 year jail term!!

I have been programming in assembly language recently and debugging what I
write is becoming increasingly painful. Inserting brk's in the monitor works
okay as long as the problem occurs on the first iteration of a loop, but
subsequent iterations can't be checked so easily. Does anyone out there know
of a good assembly level debugger? As a minimum it should have single step,
trace, and simple breakpoints (I know they had to take something from the rom
to add the auto-start capability, but why, oh why, did they take ss and trace?).

     thanks a lot,
          geoff sherwood

(I doubt it would matter, but I use the AZTEC as65 assembler from MANX)

Has anyone had any luck interfacing an Apple IIc for RTTY use?
I have been unable to locate a schematic for the IIc to enable me to be certain
that I correctly connect the TU (modem). The instructions that came with
my RTTY program (Super-Ratt) indicate that I connect to the modem port
(vs. the game port on a II+ or IIe), and that the interface be at TTL levels.
Since the game port on a II+ is quite different from the serial modem port
on a IIc in terms of its function, I am concerned that the proper circuit inter-
face be made.

My Apple dealer has told me that a maintenance manual will be available shortly
for the IIc for $50!(presumably including a schematic).

Thanks for the help.

No, No. You fail to consider the possibility that DOCTOR VAX has stolen the

disks as well. If he reserves the right to consider a program stealable if it doesn't meet his arbitrary price/performance standard then we must assume he reserves that right for hardware also. After all, a couple of dollars is *way* to much to charge for a little bit of cardboard, plastic and iron oxide, isn't it? :-)

Hi,
i just say a few things about APPLE support and PIRACY:

APPLE SUPPORT-- this has really been nonexistent for about 1 1/2 yrs now.Apple has been so wound up on the Mac that they have COMPLETELY FORGOTTEN THE PEOPLE who got them where they are today. I blame ALL of this on John Scully and Steve [mr. ego] Jobs. When they got RID of the WOZ, it was the icing on the cake. He was and IS there only link to the Apple// line. He had som many GREAT ideas for the // line that THEY never let come to fruit. You say that the // line is over and obsolete??? Well so is the 11/70 and 11/780 for that fact, but people still buy and want them!! With a base of over 2 million people and alot that canbe done with the // line, mr. scully and mr. ego have all but forgoten us. Well since the Mac is doing poorly and Apple has based its whole life on it, maybe ifthey go bust it would be the best thing. Especially for the // line. This is a very negative opinion, but having talked to WOZ (got his home # and he has not expressed the above views to me personally) this is what I and many others have seen.

PIRACY--This is such a hot topic I jsut couldn't resist. Mr. McCormack has

blamed Pirates for the failure of his business. From what I can see it was HIM and nobody else. I read his letter a few times and still feel the same way. He said the cheapest anyone evergot it with special discounts and all was around $240. This in account with the 25-40% discounts!!! That's expensive!! He also stated that if people don't like a companies Licenseing,Policies etc., then don't buy the software. Well I guess they did just that!!! To say a company went out of business because of piracy is just a bullshit cover up for there own mistakes!! Beagle Bros,Pfs,Infocom are good examples. There are alot of pirated copies of there stuff and they're doing just great! Stop crying Joel and all you others. I WILL agree that without copies the companies would be more profitable. Don't though, blame there demise on them. They had a shit product and people didn't buy it. Plain and simple!! I think Joel and Dave hough should get together. One blames his demise on pirates and the says all people who have Apple//'s are hackers. You guy deserve each other!!!!!!!

The above OPINIONS ARE MINE PERSONALLY AND HAVE NOTHING TO DO WHATSOEVER WITH MY EMPLOYER...NONE,NADA,NIEN.!!

CHOW PEOPLE...

To all [ex-]Software Publishers,

How many of you ship software packages without disclaimers stating that you take no responsibility for the software you sell regarding its fitness for any given purpose and all that bullshit? I think this is slightly illegal. When I buy something, I have a right to get a product

that will fullful the purpose for which it was intended. (At least in California this is true, Just ask Judge Wapner...) If not, that is breach of contract and I am allowed to recieve damages. You sold me something under the impression that it would do what I wanted.

    If just one company took responsibilty on paper for its product and used that as a selling point for their software, I'm sure that if they were careful about distribution. (I. E. Selling to informed customers using competent staff. (Yes, I realize that there are not too many places that have competent staff.)) In theory, software publishers should be able (or just plain, should) warrant their product to at least work, but, maybe not just the way people want. If it can be proven in court that the product is functional, there shouldn't be any problems with lawsuits.

    Maybe the seller's of software to the public ought to be held responsible for the software they sell? I don't know. There must be a solution.

Disclaiming everything is not a solution, it's running away.

No Offense Meant,

Robert Kenyon

A week or so ago I requested information about CP/M cards for the
Apple II+, and whether it was worth paying for a card that has its
own memory, and thus can run faster. My thanks to all who responded.
Since there seemed to be some interest in this topic, I'm posting
a trimmed-down version of the responses I received (see below).

A quick summary:
The December 84 issue of Byte contains an Apple supplement, in which
some 6 or so CP/M cards are reviewed.

A number of cards were mentioned by those responding: Microsoft Softcard,
PCPI Appli-card, EZ2 (from Orbital in Phoenix). In general, people
seemed satisfied with their cards; the exception was the ALS CP/M card.

I also asked about a product for adding CP/M to the Apple //c;
apparently it is sold by Applied Engineering (Dallas, TX, I think)
for $159, includes CP/M 4.0 and a plug-in(?) Z80. I was referred
to recent issues of InCider and A+ magazine for more details.

Again, thanks to everyone who sent me information.

From: Chris Maciag <wucs!ihnp4!decvax!decwrl!spar!maciag>
Organization: Schlumberger Palo Alto Research, CA

I use the Microsoft Softcard and it works just fine, however, Microsoft
just decided to leave the softcard business. I have several friends
that use the Appli-card (starcard) and love it (it has a Z80B in it, so
it is faster (3mhz?). I doubt that there will be a product allowing
CP/M on the //c, because it has no DMA (Direct Memory Access), hence,
the //c could only be used as a terminal to a CP/M computer. If in fact
you find this rumor to be true, I would appreciate it if you could tell
me, because I would love to run Wordstar on my //c. Back to CP/M cards,
don't buy the ALS card. I also have two of those (the one with 64k and
the one without. The card is poorly made, and CPM plus even worse.
Microsoft CP/M certainly is the best CP/M OS I have used. The cheap ALS
card ($100) will run Microsoft CP/M, which is nice. ALS's version of
CP/M and CP/M plus works, but it is not very fun to change. For
example, I bought a double density drive for my //e, and the owners

manual gave the patches for Microsoft CP/M. To use the drive under ALS CP/M plus, I had to do some MAJOR hacking.

I don't see the need for CP/M cards with on-board memory, except maybe increase in speed, but my microsoft clone seems to be working fine. I was hesitant about buying a clone at first -- I was offered one used a processor that was not the true Z80 (but instead, a direct clone) but after buying both that card and one with the true Z80, both seem to perform exactly the same. The layout of the chips is also the same, and the boards in general are exactly alike.

Frankly, I don't think the on-board memory is really worth the $260+ that Microsoft asks for the Softcard -- as long as I have 64k with the rest of the Apple, why get -another- 64k? As far as I know, the Z80 can't address more than that. If anyone sees more advantages in cards with on-board RAM, let me know.

-dru

From: John Shaver STEEP-TM-AC 879-7602 <wucs!apg-3.ARPA!jshaver>

I am using the EZ2 Card from Orbital in Phoenix. Their card seems to be a copy
of the Softcard. The standard software is not provided in this case. W* And
DBII work as do all of the stuff, which I've downloaded from Simtel20.
I have not found a program for the Apple (in any model) which will create a
RAMDISK in Cpm. The RAMDISK is mandatory for successful (scratch that)
satisfactory operation of programs with overlays.

A friend has the Applicard. His only problems seems to be finding Modem and
Kermit programs which work with the Applicard. It is faster and with the
integral memory uses Apple only for communication with the outside, modem,
printer, disk and console.

Best regards

There is now a CPM for the //c. I saw an announcement in the latest A+
magazine. It is made by a well known company that make lots of plug in
boards for the Apple (I forget their name now). It sells for ~$150.

****
From wucs!seismo!topaz!RU-BLUE!BRAIL Sat Mar 23 00:37:54 1985

     The only way to have a Z80 card which runs at more than the
Apple's clock speed is to put extra RAM on the card which is used only
by the Z80. Several fast Z80 cards are made with their own clock and
64K of RAM on board. They usually use the 6502 for I/O and/or print
spooling. One is the AppliCard, which runs at 6mhz (I think).

As usual, I am affiliated with no one, no way, no how.

From wucs!ihnp4!uw-beaver!tektronix!teklds!dadla!dcall Mon Mar 25 23:27:32 1985

I am currently using a PCPI Applicard running at 6MHz. This card is a true co-processor, with it's own high speed RAM. InfoWorld had a review of it and seemed really like it - it sure makes my Apple shine! I am running Wordstar and Turbo Pascal - no problems. This card works with II+ and IIe models, but I'm not sure about a standard II. It also comes with software to allow you to use the extra memory as a RAM disk. There is also a soft video interface that uses the HGR to produce 70 column text without an 80 col. card. There is a config menu to select various 80 col. cards. If you are running a IIe there is one caveat - some IIe's will NOT WORK with this card or the Digital Research Gold Card - some timing problem is involved. This didn't happen to my IIe however. For more information, there is a book out containing reviews of hardware and software by InfoWorld - "Infoworlds Guide to enhancing the Apple II/II+/IIc" I think is the title. This has some real good reviews on setup and performance.

One other note - if you want to use Microsoft's MBASIC, you must download it from another machine - Microsoft's version in Apple format only runs on their slowpoke card! The Infoworld review claims PCPI will do this for you for a small fee (~$10).

Good Luck!

I have to admit, I've never seen anything quite like this article. I suppose
the author (Dr. Vax) deserves some sort of award.

In fact, the article is so incredible, it's almost impossible to reply. It's
hard to believe that there are people out there who have such little respect
for the rights and feelings of others. Maybe the award should be the
"most insulting letter" award. Or the "most obnoxious". Or even the
"most ungrammatical".

I'm really at a loss for words here, so let me conclude with my recommendation
for the award. Does anyone have a "Pirate" style eyepatch with some nice,
sharp spikes on the inside?

First off, what disks do you use, Dysans? $5 a pop? Ick! I buy Conroy-La

Pointes for $.99 each and double-side them. Even if Doctor Vax uses Datalifes
(at ~$2 apiece in any decent discount store) his disks only cost him $1000.
Not all that much, really.

And as for the "15-20 text editors, 5 or 6 spreadsheets", you ignore the
pack-rat aspect of piracy -- many (most?) pirates are more software collectors
than anything else. Do you question a Beatlemanic's 4-5 different pressings
of the same album on the grounds that "more than one is useless?" Besides,
you don't need "shelves and shelves of documentation" for games, which is
what most pirates pirate. Just boot and shoot.

(As for the legal aspects of it, well, that is another story which I
refuse to even touch upon in THIS posting...)

DOCTOR VAX HERE AGAIN.

I HAVE SEEN MANY REPLYS ABOUT PIRACY. MOST STILL DON'T MAKE ANY SENSE. I HAVE NOT
HURT ANY COMPANIE. I DO AGREE WITH JOEL THAT IF COPIES ARE PIRATED AND "SOLD"
ASWITH LOTUS, THEN THAT IS UNFAIR TO THE COMPANY!!! I HAVE NOR NEVER WILL DO
THAT.I TRADE AMONGST MY FRIENDS ONLY.... I AM NOT IN THIS TO MAKE MONEY. I ALSO
APOLOGIZE TO THE "NET" AND ANYONE THAT WAS OFFENDED BY MY LANGUAGE. I GUESS
ITS ALRIGHT FOR GROWNUPS (JOEL) TO CURSE BUT NOT TEENAGERS. GOOD DOUBLE
STANDARDPEOPLE. I DO NOT WORK FOR "DEC" AS I' STILL TO YOUNG. I DO LIVE IN CALIF.
AND
MY NAME IS ROBERT UNGO. I'M SORRY ABOUT THE BIG WHOOPA, BUT STILL FEEL THAT YOU
JUMPED ON THE WRONG PIRATES. A TRUE PIRATE DOES NOT "SELL" SOFTWARE THAT HE
CRACKS. AS A TEENAGER I CANT ALWAYS GET THE $ FOR SOFTWARE AFTER THE PURCHASE OF
MY
COMPUTER. POOR EXCUSE I KNOW BUT REAL. I WILL NO LONGER GO ON THIS NET TO DISPUTE

THE PIRACY THING,BUT REALIZE THAT ALL PIRATES ARE NOT LIKE THE ONES DESCRIBED.

THANX

DV
BYE FOREVER

I saw Joel's reply to Doctor Vax today. I must commend him on it. I do agree with Joel that Pirates have(don't) put companies out of business. I did get this feeling though from is letter. I also AGREE with the person that a pirate that SELLS pirated copies of ANYTHING should be caught and prosecuted!!! This is definitley immoral
What alot of people also don't know is that probably 95% of the so called pirates are 12-15 yrs old. The day of the Grownup pirate is long gone... These KIDS trade this stuff like we used to trade baseball cards and comic books. I guess that's the enviorment now. Computers, Computers , Computers. They usually spend all there $ on the Computer and none left for the software. I realize this is a poor excuse,but they usually use it to justify it. They do not use 99% of what they have, in this your correct. I also read of Turbo being sold on a Campus fora low price. I agree with that and can't reason why they still copy it. It'll cost them more in time to get the manual copied. Well I will apologize to Joel for my earlier (it will probably hit with this one) statements. Well instead of fighting and wasting lots of money I and time maybe free backups(except postage and stuff) will stop it. Also let this discussion go on net.flame and lets get back to discussing APPLES.

Does anyone know of a VT100 emulator for the //e that also has a capture buffer?If so please let me know.

ADIOS....

Students should *not* be expected to buy software even if it is $30 a copy
(the price of a typical book) for the simple reason that not all students
have PC's. It should not be assumed that students taking classes which
involve PC use own PC's. How would you like to spend $30 for a book you
cannot read after a semester. Universities should buy multiple copies of
software and loan them out to the students (or restrict their use within a
central PC area). A licence for the VAX PASCAL compiler would probably run
the university $10000 and the VAX ADA compiler, $25000. With $10000, you
could buy 333 copies of Turbo Pascal at $30. and reuse them for later
semesters.

Now, now Dr. VAX. You know it's time to come in and get your water checked!

Do we have to send someone out to fetch you?? You won't like it. (They use
the bowling ball hold!)

If you come along nicely, we'll let you play with your food.

(No you don't have to bring in all your stolen software.)

Regards,

Ken Arndt

The latest Nibble has an for a][c CP/M card from Applied Engineering.
The card fits inside the case (probably voiding the warranty if it
isn't already dead). CP/M is supplied with the card.
I believe the price is around $150.

Applied Engineering has an excellent reputation. I have one of their
add on memory cards for the][e and it's great.

One caution: Putting more chips in the case will only create more heat.
I don't know what, if any, overheating problems the][c has.

Many mail order suppliers sell Applied Engineering cards. I recommend
Programs Plus (again, see Nibble).

Disclaimer:
I have no financial or other connection with Applied Engineering or
Programs Plus. If they would care to give me a commission for my
recommendations, I would be happy to change this disclaimer. I have
only a slight financial interest in Nibble.

You are quite right. However, now that you make me think about it, we
must also consider the possibility that he stole his *computer*.
Think about it. All those running-dog capitalists who are reaping
obcene profits for a small collection of plastic, metal, wire and
(let's not forget it) silicon... :-)

Finally, there appears to be some bright spot in the fight against
software piracy. I do some development work for a software firm that
produces microcomputer software for the oil and mineral exploration
industries. Last week at a professional conference for exploration
geologists we were told by representatives from Chevron, Amoco and
Marathon that it is grounds for immediate dismissal if any employee
illegally copies a piece of software! I guess the recent Lotus suits
have scarred the bejesus out of them.

Don't equate "hackers" with "pirates". From "The Hacker's Dictionary," by
Guy Steele, Donald Woods, Raphael Finkel, Mark Crispin, Richard Stallman,
and Geoffrey Goodfellow:

    HACKER @i(noun)
      1. A person who enjoys learning the details of computer

systems and how to stretch their capabilitites -- as opposed to most users of computers, who prefer to learn only the minimum amount necessary.

2. One who programs enthusiastically, or who enjoys programming rather than just theorizing about programming.
3. A person capable of appreciating HACK VALUE.
4. A person who is good at programming quickly. (By the way, not everything a hacker produces is a hack.)
5. An expert on a particular program, or one who frequently does work using it or on it. Example: "A SAIL hacker." (This definition and the preceding ones are correlated, and people who fit them congregate.)
6. An expert of any kind. One might be an astronomy hacker, for example.
7. A malicious or inquisitive meddler who tries to discover information by poking around. For example, a "password hacker" is one who tries, possibly by deceptive or illegal means, to discover other people's computer passwords. A "network hacker" is one who tries to learn about the computer network (possibly because he wants to improve it or possibly because he wants to interfere -- one can tell the difference only by context and tone of voice.

Note that only one of the seven definitions fits people like the '414s'. The other definitions more closely fit the meaning of the word "hacker" as it is used in the Carnegie-Mellon, Stanford, and MIT computer science departments. It's a shame that the media have equated "hackers" with "crackers" and pirates. Please don't help to perpetuate this misuse!

I agree that the sale of copy-protected disks should be outlawed. I have both an Apple Macintosh and a pair of Ataris (one 800, one 800XL). One thing that I like to do with software that I have purchased is to make a backup copy for my daily use and put the original copy away. On the Mac, it is fairly easy to modify certain aspects of a program using the Resource Editor, and I sometimes take advantage of this capability. Needless to say, it isn't a very good idea to experiment on original disks.

Most of the software that I have for my Atari is not copy-protected, with the exception of two Electronics Arts games (Pinball Construction Set and Worms), the Atari Macro-Assembler, and Atari Microsoft BASIC. Atari Microsoft BASIC has a lot of commands (TRS-80 Disk BASIC + some), but I don't use it often since it leaves very little free memory. I stopped using Pinball Construction Set after I lost some of my DATA files by moving them from one disk to another (the files probably contained absolute sector numbers or other such garbage). A piece of software that is useful is the Atari Macro Assembler. I removed the copy-protection on my working copy using instructions that I found in old info-atari archives, and now I don't need to worry about losing my original. I also don't need to listen to the horrible crunching sound that the 810 drive makes when it hits a bad sector (it sounds like the head is biting the dust).

I have bought exactly five copy-protected programs for my Mac: Macintosh Pascal, Seastalker, Hitchhiker's Guide, Microsoft WORD, and Sargon III. I only bought four of these programs because I had a reasonable expectation of being able to circumvent the copy-protection. This assumption turned out to be true in three of the four cases; Hitchhiker's Guide has much better protection than the other Infocom game. I bought Macintosh Pascal despite the copy-protection, but I now regret that decision. (Macintosh Pascal has the most nasty copy-protection scheme of which I have ever heard, other than the "Killer Prolok" scheme which will actually try to damage your computer).

Recently, I faced the choice of which C compiler to buy for my Mac. There are basically three that seem to be worth considering: Aztec C, Consular C, and Megamax C. Aztec C is copy-protected, Consular C is copy-protected (but you can get an unprotected version for $25 more), and Megamax C is not protected. Guess which one I bought. I am now the owner of a copy of Megamax C version 2.0, and my checking account is $188 poorer. (If I had paid list price, it would have been $299 poorer, but the Computer Store gets stuff at a discount).

And finally, before anyone flames me to say that "it's fine to advocate an end to copy-protection, but you're not getting hurt": I did write a couple of programs for the Atari 400/800 which were sold through the Atari Program Exchange (now defunct). Neither one was copy-protected, and both came with source code. (I wasn't the only person to follow this practice; one of the nice things about the Atari 800 is that you can get full source listings of the entire operating system, disk operating system, and BASIC. Compared to the "operating system" on many other low-cost computers, the Atari 400/800 operating system is very comprehensive). I don't think it's right to screw the people who purchase your program, even if it would make a pirate's life somewhat harder.

Ok guys...this is heading off in a weird tangent.

I confess...I knew many pirates some years ago. Many pirates. Learned
which boards they hung out on. How many disks they had. How they got
their "wares". How they congregated.

And names. Many names. 1200 club. Super Pirates of Minneapolis. The
Underground. Hi-res Hijackers. etc.

But not one of these people stole their micros, nor their disks. Usually,
the micros were another "my dad bought it" item, and the disks were gifts
from other grateful (read: lesser) pirates. All the way from the guy with
4 disks, to the fellow with 1500 double-sideds. Yes, there really were 1500.
And don't tell me that he used them all every day. He couldn't BOOT them all
in a day.

In fact, they used to issue "statements of purpose", detailing their morals,
why they pirated and phreaked, and why they wouldn't support
piracy-for-profit. These people were anarchists, not hardened criminals.

And they didn't steal their computers.

This is a short addendum to Elizabeth A. Evans' comments about copyrights on software.

I've written and published copyrighted material, and the US laws read that a work is copyrighted at the moment of its creation. It is not, however, protected in the eyes of the US courts unless its copyright is registered with the Library of Congress. This registration consists of filling out a form for application and submitting that form together with two copies of the work and a $10.00 fee to the Registrar of Copyrights.

With regard to making backup copies of software, recent US court decisions have established that the PURCHASER of a software product has a guaranteed right to make backup copies, such copies to be used only by whoever is in possession of the original, for the purpose of recovering from destruction of that original. What this means is that giving or selling copies to anyone else, without giving him or her all the backup copies you have made, or else destroying them, is a violation of the copyright law. It also means that LENDING a disk to someone and then using a backup copy yourself whilst the original is out of your hands is a violation of the law. As for a licensee's right to make backup copies, that's a negotiable item between the licensee and the licensor.

NOW we come to the line of how this discussion relates to piracy. Piracy is, and will continue to be, illegal. Period. It will also continue to exist. Making a tape of an LP album is a violation of the copyright law, if we give it away or sell it, and videotaping most TV programmes is a similar violation if done to distrubute copies. So we are back at the fact that we are all violators - heck, xeroxing a book is ALWAYS illegal unless the person doing it has written permission from the copyright holder.

The furore that piracy raises is caused, I think, by the fact that we are computer people. Computers, and their software are for many of us our livelihood, or soon will be. We feel endangered by pirates. So we invoke all the legalistic arguments, and when that doesn't work we cry out against the ethical and moral standards of pirates.

Pirates are, for the most part, young people. They build huge libraries of pirated games. It's a game, a challenge, for them to crack a protected

disk. So they crow about their success and pass copies around with the title screens changed to include their noms-de-crack, to prove that it was actually they who did the job. There is, I admit, some amount of piracy of utilities, but I really believe that most of the pirated utilities never get used, for the lack of hardcopy documentation. A friend had a pirated copy of VisiFile, and he wiped it when he figured out that he didn't know how to use it... I agree with those who say that piracy can and should be reduced (it'll never be stopped!). The ways to do that include Borland's approach, which is hard to emulate. They also include making products so truly useful that they are worth their cost - this usefulness revolves largely around making superb hard documentation in addition to good programming, and pricing skilfully, and finally supporting what is sold. Copy protection isn't the way to do it - the element of challenge is there, and the legitimate user who isn't a Locksmith or Copy][+ or Nibbles Away wizard is stymied when he tries to exercise his legal right to make backups.

Cheers,
Dick Binder

Hello,

In all the articles that I have been reading, one think keeps being repeated and repeated.

Software stealing is as bad as robbing a bank or holding up a 7-11 except on a smaller scale.

Piracy is a bad term for copying diskettes. When you steal a program, you are making a copy of it and not taking from the other person. You are not stealing it or pirating it but you are COPYING it.

Better lets call it:

Software stealing is as bad as copying tapes or records.

Another thing is that not all copying is for stealing purposes. Some people back up software with "the great pirate programs". Last week in the local apple computer club, a new rule was created.

No copying is allowed in the club. Anybody caught copying software will have all the software they have on them checked to see if it is a copy and not the real thing. If it is a copy, IT WILL BE ERASED!

Two days later somebody went into my backpack and took most of my diskettes. True, some of them were copys but most were the real thing. If you are not allowed to backup your disks, how are you to protect yourself? Most copying is for pirating purposes so that if somebody said, " I am backing up this stuff " , what are you supposed to think? The thief knew you could not get me to copy it for him so he stole it.

Send me mail . . . I L O V E mail

Josh Siegel

I agree, students shouldn't *have* to, but that's no justification of piracy,
period! The fact that a university professor could encourage such behaviour
in students adds insult to injury.

AN APOLOGY is offered to those readers of net.micro.apple who are most likely becoming weary of reading piracy articles and would like to see a return to discussions of those great little engines from Apple Computer, Inc. But please allow me to squeeze these few thoughts in before the book is closed.

I do program development for a small software firm out of Denver. The company (which I will not name unless requested by mail) puts out some very fine products for the petroleum and mineral exploration industry for use on microcomputers. The founder of that company is an absolute fanatic when it comes to the pricing of these products; using the startegy (but not, unfrotunately, the resources) of Borland, he insists that all software be priced as cheaply as is possible. The development costs are recouped over the long run rather than the short. The result is that a product designed to compete with a $5000 package will be priced around $1500. And products that would normally sell for $1500 are priced at less than $100. We predicted heavy sighs of corporate relief and a mailbox stuffed with purchase orders.

What we got was a few purchase orders and a lot of long distance phone calls that may summarized with "What's the catch? At only a hundred bucks it can't be very useful." Only time will tell if our pricing strategy was a good idea. By the way, the software is minimally copy-protected (PROLOK) because the low prices coupled with the small market precludes staying in business if piracy becomes a significant factor.

It is very difficult for any small business to make it. It is the smaller concerns that seem to make most of the advances in any arena and there is no guarantee that these advances will be rewarded financially. So the average small business person ends up working hundred hour weeks for no money trying to build a living, breathing entity where once there was but a void. In spite of media bally-hoo, not everyone in the computer industry drives a BMW and spends evenings drinking french wine in a hot tub. There are one hell of a lot of us driving ten-year old cars and eating PBJ sandwiches trying to make our little places in the sun. And if we don't make it, well that's what gambling is all about. But another factor to be reckoned with is finding a job after the company goes belly-up. It is very difficult

for a former entrepreneur to find a position in corporate America.
The personnel people (oops, Human Recources Specialists) believe "Once
an entrepreneur, always an entrepreneur." You are considered unlikely
to be a team player. You cannot be trusted to stay with the job
because you will most likely leave and start up a company with the knowledge
that you have gained while in their employ.

Look, I'm not trying to elicit sympathy from anyone. I know the
risks. I know the rewards. But I am trying to make some points that
have been under-treated (boy, I'll bet I get flamed for that one) in
this discussion. There are no simple answers like "Just lower your
prices and do away with copy-protection" (sorry, Mr. Pournelle). It
also does no good to tell people like DR. VAX that he is doing wrong.
He knows that. There will always be people with a set of values like
those possessed by him. They are the ones who drive drunk. They turn
street signs around. They go hunting at night out of season. They
piss on toilet seats. They cut you off in traffic. They write their
names on walls and pirated software.

I firmly believe that the great majority of those starting up new
companies, at least in this industry, are honestly trying to make a
real contribution, with the profit motive secondary. And if I did not
think that there is a simple grandeur in that, I would not be doing
it. But I also believe that we deserve an even break.

That's all,

Frank

I am a little surprised by the seeming acceptability of the notion that
so long as software pirates don't make money from their thievery, that
such activity is OK. Theft is theft, simple enough, and the fact that
these kids may be just playing some sort of "game" rather than engaging

in serious entrepreneurship doesn't make it something else.

Some say it's "only copying." What do you think the term "copyright" (copy right) means? It doesn't mean the right to sell something, it means the right to determine (within clearly specified limits) who can copy a work and for what purpose. Unless it is specifically stated in the terms of the copyright, if you don't own it you can't copy it for your own use.

Is copying software like copying records, tapes and VCRs? You bet. If you make copies of the above for other than your own use you are absolutely in violation of the law.

People, there is a raft of public domain software out there that is yours for the asking. There are lots more programs that need to be written for folks, like you, that cannot afford the addmittedly steep prices of commercial programs. Given the number and sophistication of the programs which can break copy protection schemes, a large amount of stolen software is a poor measure of an individual's ability to hack. If you think you're that good, write the programs that need writing. If not, stop cutting into the rights of the folks who are trying to make a living.

Does anyone know what was resolved from the discussion a few months ago about the apple losing characters at 1200 baud?? Unfortunately I didn't pay much attention then, but now that I have 1200 baud, I would like to know what the results were. Does Ascii Express lose characters? Is it a matter of just

re-writing the screen drivers, or is it more complicated? Would 40 col. lose as many characters? Thanks,
                  Andrew Rahme.

There are a few products that may help. Two from DataMost Software,
PDQ (Pascal Disk Utility) and Randy Hyde's P-source.

First Byte publishes Bug Off! (tm) a Pascal Debugging System for
Pascal 1.1 & 1.2.

DataMost Software's stuff is more for operating system debugging and
I think it has a P-Code dis-assembler. I don't know if it is updated
for Pascal 1.2.

Bug Off! (tm) looks like what you want, although it is probably not
as powerful as sdb, it is about as good as you are going to get
on a 64k Apple. It seems to have all the necessary commands and will
even save the debugging environment for latter retrieval and testing.

Disclammer:
I have never used any of the above products and not associated with any
of the above companies (except maybe for Apple since I own an Apple //e).
Everything above is either a trademark or registered trademark of some
company or other. And of course, nothing of this has anything to do
with my employer.

A hacker is someone who patches binaries so that his program
works better. If it was someone else's program, he is a GOOD hacker;
If it was "protected" software, he was a EXCELLENT hacker.

If he gives the (purchased) program away, he is a PIRATE.

PLEASE- NO MORE BAD PRESS

Do you know of a way to convert text files on a DOS3.3 disc to ProDos, to
permit editing with a word processor such as Appleworks?
The computer is an Apple IIc. The IIc Systems Utilities does not work.

I use Apple Pascal quite a bit on my IIe. I currently have version 1.1 both on
floppy and on my Corvus. My question - Does the version 1.2 offer a
substantial upgrade to 1.1 ? What are the new goodies ?

I have been informed that the upgrade policy has been expired by Apple
and to go to 1.2 I will need to purchase the complete package. Is
this true ? Is it worth it ?

Please reply by mail. If there is sufficient interest, I will post to
the net. Thanks in advance.

I have a Franklin 1000 with a Hayes micromodem II.
I have been trying to use the modem for a file xfer with notable failure.
I have copied the programs in the manual and about the only one that
works is the self test. I am trying to connect a Kaypro 2 to my Franklin
thru a null modem and would like to reference the board thru addresses
rather than thru "in#.." and "pr#..". If you have done this or can help
I would appreciate your response. My milnet address is "medin@nosc".
                        Thank you Ted

It does? I've seen it happen. A copy of the super-rogue source is
probably worth f77 source (at least) on the open market.

*** REPLACE THIS LINE WITH YOUR MESSAGE ***
I posted a query last week asking if there was a debugger for Apple Pascal.
By and large the responses were negative (some maybes, no affirmatives).

I think it's evident to anyone who has used Apple's Pascal that the error
messages are generally not very useful. I won't bother with the indictment.
Let me propose a debugging technique that is crude but effective,
and expandable.

Given a procedure "X" that is compiled and linked into the buggy program,
but never actually called by the program. When the OS traps an error,
instead of (or in addition to) the usual "Urrp! Press any key to reset",
the OS would invoke the procedure X. Presumably X has not been trashed out
by the error (no guarantees on that one), and X has enough knowledge of
the memory map and stack frames to perform some reasonable debugging.

X can take on many forms. One that might be useful would be the proverbial
"core dump" routine. To wit: X dumps the Apple's memory to a disk file
for later analysis. This has several advantages: X is small; the machine
will be in a sane (reset) state during the analysis; several kinds of
analyzers could be used independently or together on the same core file.

The analyzers could be interactive (ala sdb), or a simple stack back trace
with local variables displayed (always in good taste). This is the

expandable part: not only can the person-one-smarter-than-you write a useful analyzer for Apple Pascal users, but the core file could be "standardized" such that it could be transportable to others.
Just think: a whole new industry of core-fixers. Just send them your core dump and a check, and poof! back comes your bug, all solved.

Now for my next query. This is targeted primarily at Apple Corp. & UCSD. How can I get the OS to invoke my function "X" when it has trapped a fatal error? How can I get more details on the memory layout, stack frame and global areas in Apple Pascal?

Ever Forward,
tim born

Does anyone know of any CHEAP (around $50) clock/calendar cards for the Apple][series computers?

It seems that all I see are the Thunderclock (~$109) and something from AST (clock, parallel & serial for ~$139).

If they put a clock, parallel and serial port on a board for $139, why can't they make a clock/calendar card for $50?

Any help would be appreciated. Mail me and I'll post the results.

As I mentioned in an earlier posting, I am trying to locate an assembly
language debugger for my Apple IIe. I did receive one response (from
Patrick Hsieh -- thanks) which mentioned a 6502 debugger from Aurora
Systems called Quicktrace (I am not exactly sure of the company name).
I would appreciate any information on either this company (like
an address, reputation, etc) or the debugger? The description Pat gave
made Quicktrace sound VERY attractive (fancy breakpointing, continuous
screen updates of several registers and memory loacations, etc).

Does anybody know anything about the rumor that Apple has a Pascal 1.3 in
the wings that runs under Prodos?

On another topic, does anybody know if Pascal (either version 1.1 or 1.2)
runs without modification on an "enhanced" IIe (With the 65C02 processor and
the new ROMS)? If not, does anybody have (pointers to) the patches to make
it work? I am seriously considering buying the upgrade kit, and don't want
to lock myself out of the Pascal world.

Recently, I foamed at the mouth (on this group) about the apparent
move by Apple Computer to eliminate its Customer Tech-Support Line.
In fact, this month's issue of CALL-APPLE hadd a letter from a
similarly irate user.

Well, this week at the 10th Computer Faire, held in San Francisco, I
got to talk to someone from Tech Support Communications. He assured
me that Apple has no intentions of eliminating support for its
technically-minded users (read: hobbyist). He said that Apple was
EXPERIMENTING with alternatives to the ballooning Tech Support
problem. San FRancisco was chosen as the first test region.

I was told that there are some 192 engineers around the country who
answer the Tech Support phones, each answering 40 - 50 calls/day.
In addition to their salary, there is the expense to constantly
re-educate them. The cost apparently runs into the millions.
In additon, customers as well as dealers had much trouble getting
through to the swamped phone lines. Plus, much of the support was not
truly demanding the time of an engineer; much was "trivial" and could
have been answered by even the kind of secretaries who now staff the
typical Apple dealership.

Apple dealers, and certified registered Apple developers are now the
only ones (in the S.F. area) who can contact Apple Tech Support.
Apple dealers have the Apple Link, a Macintosh-based Email system,
complete with password, to send questions to Apple. Of course, the
answers are not in real time, and they/you cannot converse with the
engineer. I don't know how developers are handled (voice or Email).
I assume the dealers could call (voice) if they needed to. However,
can you imagine badgering an Apple dealer to Email something, thus
involving typying, about something he can hardly comprehend? An the
answer will come back the same way. My dealer barely has time to
answer the phone in incoming calls!

I made my views known to the Apple person I spoke to. We'll have to
wait and see how Tech Support evolves.

I read in a current medical journal (my wife is a doctor) that someone
had come up with a clever solution to piracy... They give out software for
free, and urge that it be distributed.. The rider is that the software
contains a header notice inviting all users to contribute to the development
of additional software (if they liked the product) by making a charitable
donation to the developers of the software...
Frankly, I strongly suspect that most receivers of under-the-counter software
would be glad to contribute to the developers but don't have any reasonable
way of doing it. However, most people hate parting with cash too....
Overall, this seems like a risky venture but probably no riskier than any other
distribution method. As said earlier I market bridge and cribbage software
for the P.C. and my advertising is current over $1,000 for 7 small lines in
the blue book of P.C. for 6 issues.. That alone has put me out of business
since sales are at around 100 copies.
If anyone likes the above copy-protection idea send mail to me..
I don't read net.games as much as I should.... all work and no play...

> ... US laws read that a
> work is copyrighted at the moment of its creation. It is not, however, pro-
> tected in the eyes of the US courts unless its copyright is registered with
> the Library of Congress.

That ain't the way I heard it. Registration gets you the right to
punitive damages and so forth, but you can sue over theft of
unregistered material as well.

> ... heck, xeroxing a book is ALWAYS illegal unless
> the person doing it has written permission from the copyright holder.

No, there's something called the "fair use provision" of the law (a
codification of older common law now in the statute) that permits a
reasonable degree of copying. Copying a part of a book for limited use
is perfectly legal. The issue is whether enough copying is done so that
sales of the original work are potentially damaged. Incidentally, about
a year or two ago a major university was hit with (and lost) a
substantial suit from a textbook publisher when it transpired several
faculty members had been actively producing their own texts for courses
by selectivly copying chunks of various anthologies.

An aside: Not being overly worshipful of physical objects, I've always
thought the notion of property theft misleading, especially in the case
of intellectual property. If I could easily make a car, it would not
bother me much to have my car stolen. What bothers me is the work it
takes to replace it. It is theft of my labor and my time that disturbs
me.

If I work as a programmer and produce a program, someone presumably
pays me for that work. Suppose I work as a software developer (or, for
that matter, novelist) and create a package for sale. Each purchaser
can then buy the program at a fraction of what it would cost to hire me
for a custom program. That should make them happy. In return, I have
the potential to make a lot of money (if I'm very lucky), and that
should make me happy. Unfortunately, some people feel they have the
right to give away or steal my work because I still have a copy of it
and hence nothing has been "stolen". A little thinking should show
that this is irrelevant. Unfortunately, we're so ingrained to think in
the convenient shorthand of property rights that we don't think.

You can't. You can get the operating system to try to continue
running your program (if you think it might help) by pressing <esc> at
the "type space to continue" prompt.

> How can I get more details on the memory layout, stack frame and
> global areas in Apple Pascal?

There is an Internal Architecture Guide available for version IV of the
system, so there *may* be a version for II.1 (on which the Apple
system is based). If it isn't available from Apple, it may be available
from Softech Microsystems (619)451-1230. Make sure you don't get the
guide for version IV because it is very different.

I know this doesn't help much, but you could always change to UCSD p-System
version IV.13 (available from Softech for a very costly price).
It *does* come with a symbolic debugger and it seems pretty nice, although
I don't use it. It also has a number of nice features that the
Apple Pascal system doesn't have. It is also very slow on an Apple.

I posted a query last week asking if there was a debugger for Apple Pascal.
By and large the responses were negative (some maybes, no affirmatives).

I think it's evident to anyone who has used Apple's Pascal that the error
messages are generally not very useful. I won't bother with the indictment.
Let me propose a debugging technique that is crude but effective,
and expandable.

Given a procedure "X" that is compiled and linked into the buggy program,
but never actually called by the program. When the OS traps an error,
instead of (or in addition to) the usual "Urrp! Press any key to reset",
the OS would invoke the procedure X. Presumably X has not been trashed out
by the error (no guarantees on that one), and X has enough knowledge of
the memory map and stack frames to perform some reasonable debugging.

X can take on many forms. One that might be useful would be the proverbial
"core dump" routine. To wit: X dumps the Apple's memory to a disk file
for later analysis. This has several advantages: X is small; the machine
will be in a sane (reset) state during the analysis; several kinds of
analyzers could be used independently or together on the same core file.

The analyzers could be interactive (ala sdb), or a simple stack back trace
with local variables displayed (always in good taste). This is the
expandable part: not only can the person-one-smarter-than-you write a
useful analyzer for Apple Pascal users, but the core file could be
"standardized" such that it could be transportable to others.
Just think: a whole new industry of core-fixers. Just send them your core
dump and a check, and poof! back comes your bug, all solved.

Now for my next query. This is targeted primarily at Apple Corp. & UCSD.
How can I get the OS to invoke my function "X" when it has trapped a fatal
error? How can I get more details on the memory layout, stack frame and
global areas in Apple Pascal?

Ever Forward,
tim born

In response to Gary Grady:

>> ... US laws read that a
>> work is copyrighted at the moment of its creation. It is not, however, pro-
>> tected in the eyes of the US courts unless its copyright is registered with
>> the Library of Congress.

> That ain't the way I heard it. Registration gets you the right to
> punitive damages and so forth, but you can sue over theft of
> unregistered material as well.

True, you can indeed sue. Convincing a court that an unregistered work was originally yours is the difficult part, unless you can produce credible disinterested witnesses who will depose that they saw it with your name on it BEFORE THE DEFENDANT COULD >POSSIBLY< HAVE PRODUCED HIS OR HER FIRST COPY. And that's tough, unless one of your witnesses is the defendant's roommate or a close co-worker! Hence, unregistered works are not really protected. The instruction pamphlet that the Registrar of Copyrights supplies to those intending to register makes it clear that the whole point of registration is to provide you with just the proof you might need in court.

>> ... heck, xeroxing a book is ALWAYS illegal unless
>> the person doing it has written permission from the copyright holder.

> No, there's something called the "fair use provision" of the law (a
> codification of older common law now in the statute) that permits a
> reasonable degree of copying. Copying a part of a book for limited use
> is perfectly legal.

Not necessarily. It is usually tolerated because enforcement of the copyright protection is not possible, but take a moment to read the notices in a couple of books - here's a fairly standard one:

Copyright 1985 by ...

> All rights reserved. No portion of this work may be re-
> produced or represented in any form, including but not
> limited to optical, mechanical, electronic, or magnetic
> copying, storage, or transmission, without the prior
> written consent of the copyright holder.

Such a statement is crystal clear - you copy my book, even one page, and if I find out about it I'll roast you over a slow fire. Many works include the provision, "except for brief passages by a reviewer for use in a review", which nails it down even tighter by specifying the one permissible incidence of copying.

> An aside: Not being overly worshipful of physical objects, I've always
> thought the notion of property theft misleading, especially in the case
> of intellectual property. If I could easily make a car, it would not
> bother me much to have my car stolen. What bothers me is the work it
> takes to replace it. It is theft of my labor and my time that disturbs
> me.

Ah, what a wonderful attitude! :=) I tell you what: You find a nice house that you especially like, perhaps getting a realtor to locate it for you so that your own time and effort will be minimised. Then I'll come and live in it, leaving you to find another. I'll pay you a fair wage for the time you spent looking. I doubt you're ready to agree to such an absurd proposal, but, after all, you shouldn't care - it's just a piece of physical property.

> ...Unfortunately, some people feel they have the right to give away or steal
> my work because I still have a copy of it and hence nothing has been "stolen".
> A little thinking should show that this is irrelevant...

The whole premise of intellectual property is just that - though such things are intangibles, i.e., how do you weigh the thought required to produce a line of code, they are still very real. They are an actual investment made in expectation, or at least hope, of a return.

Cheers,
Dick Binder (The Stainless Steel Rat)

A good source for the internals of Apple Pascal is "All about Pascal"
published by CALL APPLE. It describes Pascal version 1.1, not 1.2.
Another source I have heard about is "P-source" by Randall Hyde
published by
  Datamost
  8943 Fullbright Ave.
  Chatsworth, CA 91311

I have never seen P-source but an engineer at Apple once refered me to it
when he couldn't answer my question.

I've kind of given up on Apple Pascal. It is too slow and doesn't talk
with the rest of the Apple world (i.e. PRODOS). For people who want to
program in Pascal on the Apple (and do not need graphics) I recommend a
6mz Z-80 card and Turbo Pascal. The editor that comes with Turbo is so
much better than the @#$% UCSD editor! Turbo seems to takes as much time
to compile and start a program as Apple Pascal takes to start an already
compiled program.

I'm still waiting for a Pascal compiler that produces 6502 code and runs
under PRODOS. Maybe the new 65C02 chip will inspire some developers.--

Standard copyright provisions which do not mention the allowance of "fair use"
copying do not over-ride the copying for fair use, since these are guaranteed
by the copyright act.

As an aside, I don't know how applicable the fair use laws are to software.
Presumably the people who run "software evaluation clubs" are trying to fall
into this catagory, but I don't think the courts would agree.

I have all the clues on the 6th level of Knight of Diamonds
but haven't been able to puzzle out the answer to the
riddle of the Sphinx. The obvious things haven't worked.
Hints or outright answers would be appreciated.

[... carnage ...]

Well, hi there again! First, thanks to all (18!) of the honest Netters who
replied to me 'bout the Megamax-C thing. All the necessary info has been
forewarded to Megamax and the plan to deal with it accordingly. (I am still
hopeful of no copy protection scheme)

Second, for all of the Megamax-C OWNERS out there I will be accepting
Bug-Reports on the Megamax-C Compiler/Linker, etc package. NOTICE I said
BUG_REPORTS, not programming questions, etc. If the programming question
has somthing to do with a bug or a fix there's a chance I can help.
I will provide this service for a while to see what kind of turn out I get
and as a disclaimer, I reserve the right to quit it at any time, etc.

I recently purchased "Inside Macintosh" in order to do some development work.
However, no documentation was supplied that described how to use the utilities
on the 3 MacStuff disks. For example, when I opened the Font Editor I only
received the 'watch' icon and no matter how long I waited the watch didn't
disappear. When I clicked the mouse, the system bombed. Then I tried to create
a screen using the 'screen maker'. The system didn't bomb but the next time
I loaded the MacStuff disk, the screen I created showed up instead of the
<Welcome to Macintosh> screen. I assumed screenmaker was to transfer screens
created in MacPaint to applications.

Can anyone shed any light on this. Where can I get documentation describing
the use of the MacStuff disks? Can anyone help me get started using these?

Thanks!

Can anyone give me a barebones description of what the resource manager does
and in particular how to use it within the framework of Softech's MacAdvantage?
I have been reading Inside Mac and Softech's reference manual and am totally
confused. The ID nos. in Inside Mac seem to be 'magic'. Where do they come
from and how do I determine whic ID nos. to create for my particular application?
I am only starting to work with the Mac and would appreciate any information
no matter how basic!

Thanks in advance!

Yes, this book is still available. I'm surprised you haven't been able to
find it. Most well stocked, Apple-oriented computer stores carry it, and
its companion 'Beneath Apple PRODOS' (Data Domain in Schaumburg has it).

Anyway, the publisher is:

      Quality Software
      21601 Marilla Street
      Chatsworth, Ca 91311

These books are also available from Call-APPLE, one of the largest Apple
user groups around. It is worthwhile for Apple users of any skill level.
Their address is:

      A.P.P.L.E.
      290 S.W. 43rd Street
      Renton, Wa 98055
      (206) 251-5222 or (800) 426-3667 for orders or membership application.

*** REPLACE THIS LINE WITH YOUR MESSAGE ***
I just attended a demo of Lotus' Jazz for the Macintosh (version .23).
Here is what little I know:
1.) You need 512k and an external drive
2.) It has communications (VT100,VT52)
3.) It has word-processing (looks just about like Macwrite as far as features).
4.) Great graphics, database, spreadsheet.
5.) Suggested price: about $595
6.) Release date (it looks like) - End of March.
  Jazz was really impressive-everything is integrated quite well; you can
copy a graph into a wp document and rescale whenever you feel like it; you also
have
the option of having the graph change depending on whether the original data
changes or just freezing the graph the way it is.
    As far as speed, it was pretty good, not hampered by the drive, as everything
is in RAM. One important difference between Jazz and 1-2-3/Symphony; Jazz
doesn't allow macros. You can still do formulas for the spreadsheet, but as
for large, complex operations ranging from option to option, forget it. But
with the Macintosh user interface, it may not matter too much.
    Altogether, it looked real slick, except when I selected "quit" and got
a system bomb.
    I think people are gonna love it - it's a natural Macintosh-type application.

Hi All,

There have been rumors about a 65816 cip fo a while now. I've heard that it is
pin COMPATIBLE with the 6502/C02. T6he main problem i can see though is that
applebus. Whether anyone will come with a way around this I don't know. As for
the Beneath pple Dos book.... Yes it's still in print!!! You jsut have to find
a good computer store Also the person that put the question on the net about
seeking with a drive. All you have to do is enter the trk/sec in B7EC/ED (its
in the book) Let Apple's RWTS do the rest for you. Unless ofcourse you want to
make your own RWTS... In any case I would use there WTS.

Note: A while ago I posted on the net that APPLEWORKS doesn't support the
OKIDATA 92 pinter (or any okidata) Well they still don't but if you have any
printer with a GRAPPLER [+ too] you MUST get the APPLEWORKSconfiguration
Now when you try and print in 96/132 etc.. mode it'll work right. The ONLY reason
that this came about is due to the people that make the Grappler--Orange Micro.
It still seems that apple refuses to help out thUSER!!!!!!!!!

have phun!!!!

Back when I owned an IBM PC I won Ultima III. If you could be a bit
more specific with your questions, I should be able to answer your
questions. Wish the game would come out for the Mac...

A few weeks ago I posted an article asking how one might use the RAM serial drivers. I got a lot of replies but they were from people who also would like to use the RAM serial drivers.

Has ANYONE ever really used these drivers? If so could you please post some information about how one actually does it. It seems I am not alone in wanting this information.

I am using SUMacC but others seem to be using stand alone C compilers. I did not recieve any mail from anyone using a Lisa. Perhaps the drivers exist on the Lisa systems.

A SOLUTION:
If you just want to use the RAM drivers to handle the Xon/Xoff then you can get by using the ROM drivers by just checking the fullness of the buffer every once in a while and sending a ^S if it gets too full. Later when you have read the buffer remember to send a ^Q to start things back up again. This is a hassle but it seems to work. Hopefully this will be eliminated if we can figure out the RAM drivers.

There is another book out now which is better. I think it is called the Apple Programmer's Handbook. Though there are many books out with similar names, this is the one that came out just this year and with totally worthwhile information. Among other things, it has much of the basic information in the Beneath Apple DOS book. Unfortunately, it doesn't go into PRODOS.

Summary:

I tried to execute some of the unused 6502 opcodes and found one that seems to conform to the described HCF specs. That is, the processor seems to hang up and doesn't go anywhere until it gets a reset.
   Of course, I didn't let it sit there long enough to find out if the processor would self-destruct. If anybody is willing to satisfy our curiosities, the op-code was $12. As noted, the presence of the HCF instruction may depend on the chip manufacturer. Unfortunately, I forgot to check who made mine.

     The Macintosh version of Ultima III is in the works. I won't venture
to say when it will come out, but it will come out in a "little while".
The author of the IBM version is doing the Mac version also.

> Does anyone out there, have, in any language (high level), for any
> computer, a program which will do simple two dimensional curves on a
> Diablo printer.

I have a slightly kluge-y way of doing this on the Apple.

First, I create a graph using the Interactive Microware, Inc.,
(State College, PA (814) 238-8294),
package called Graph-Pak ($145). I use the section called Scientific
Plotter, which is available separately for about $30 or $40.
You can input your data by hand, or read it from a disk file.

If you want, you can use their Curve Fitter program, available
separately for $35, to fit the data with various smoothing
schemes. The fitted data can then be passed back to the
Scientific Plotter for axes and numbering.

Once you have the final graph, it is usually dumped to a graphics
printer, using a Pkaso-U or Grappler+ parallel card. Instead, I
save it to disc.

However, since I have a serial printer, both a C. Itoh dot-matrix,
and a Qume daisy-wheel printer, I opted for something else.
Smartware of Dayton, Ohio (513) 426-3579, makes a software package
called ADVANCED GRAFPAK which lets one dump HGR screens 1 and 2 to
almost any printer, dot-matrix or daisy-wheel, using either serial
or parallel cards instead or a hardware graphics dumper.
It is not as fast as a dumper card, but it is reasonable,
especially at the $35 price. It is also available from
Interactive Microware, Inc. I then load one of the graphs from the
disc I created above, and then run it using this GRAFPAK. You
have a choice of printing characters; I use the period for the
line graphs.

I think the Roger Wagner Software program called
PRINTOGRAPHER also serves a similar function to ADVANCED GRAFPAK.
You still need to create a hi-res graphics screen to dump from.

From: Emil Rainero <emil>

I just got a mac and it doesn't look like I'll ever return to my apple II+.

Would you like to buy any of my games for the II+ cheap?
Please note that these are the original disks.
Incomplete list: (complete original documentation)
     Computer Bismark($20)
     Pinball ($10)
     Germany 1985 ($25)
     Thief($10)
     Snack Attack($10)
     Warp Factor($10) (lost the documentation)
     Sargon II($15)
     Invasion Orion($10)
     Stellar Trek($10)
     Epoch($10) 3-D game
     A2-FS1 Flight Simulator($15)

Crossfire($10)
Operation Apocalypse($10)
Computer Conflict($10)

Languages: (almost complete documentation)
GrafForth($50)
Big Mac macro assembler($10)
Dos Tool Kit($10)
Lisa Version 2.5 (lost the manual)
Symbol Symon($10)
(some kind of lisp)

Magazines: (best offer per magazine)
please note that some issues may be missing. Mail me your request
and I'll let you know exactly what you will be getting.

Scientific American (1980-1984)
Creative Computing (1980-1983 July)
Micro (1981-1983)
Omni (5/1981-1984)
Compute (1091-1983 June)
Discover (1981-1984)
Call A.P.P.L.E. (1978-1984)
Nibble (Vol 1-3)
Byte (Sept 1978-1984)
Beneath Apple DOS ($5)
Whats where in the apple($5)

Hardware: (most is four years old) (I'll take the best offer)
How about a 16k card($75)?
300/1200 baud applecat modem ($100)? (com-ware II software)
Two Lobo Floppy Disk Drives ($300 each)?
Apple II+($700)?

I don't want to go through all the shipping cost headaches, so please
let me know how you would like things shipped. For now mail me your requests
and questions. Please no orders less than twenty dollars.

RE: Apple II[+-] I/O driver question

I have a card that has ram in the 256 byte rom area for that slot.
It makes the writing of a custom I/O driver very convenient.
I have a printer driver that works fine with basic and most software,
but it fails with some software like the Merlin Assembler.
Somehow Merlin is deciding that the custom driver on my card
is not a printer and sending the wrong stuff. What is it
using to make this decision? Is there some standard for I/O
drivers that I don't know about?

And how do I make my voice do this?

Thanks,
Jeff Hagen

This is the exact instruction which I mentioned in my previous article.
$12. I think that there must be some truth in the HCF instruction for the
6502.

I wish to sell my Passport Design Keyboard, Mountain Music System with Software
including Notewriter, Music Tutor, Performance software (4 tracks) and
Turbotraks (16 tracks). All in original box, and with original documentation.
Everything is in perfect condition. Selling because I have no time to play,
and want to use my Apple's slots for something else.
I am asking $1200 for the lot or best offer.
It works on all revision Apples (I have a Rev. 1 board).

I won this one my own before I got the book.

>I know about going down the whirlpool, and can buy up my stats any time
>I want. I have the Mark of Kings and the Mark of Fire. My guess is, I
>should be able to get the Mark of Force and the Mark of the Snake if I
>go down enough dungeons, although this may be optimistic. I've gone to

Go to the eighth level of the dungeon on the large island east of the mainland
     for Mark of Snake. Force should also be down here. If not go
     to the west on of level 8 in the dungeon surrounded by lava
     in the dark mountain area at the south end of the island (the same
     dungeon with the Time Lord).

>where Dawn is supposed to be and waited a coon's age for something to happen.

from castle go west 7 and south 34 . Wait till moons are at
     (0) (0). A town will show up near you. Step onto it and enter.

if yo miss it then wait for (0) (0) again.

>It hasn't, so I suspect I have to do something else first. I have yet to
>see any cards, so I guess I'll have to check out more dungeons. The Lord

The cards are under the Shrines. <Search> and <PRAY> at each shrine.
I think the command is search. The cards are under each shrine.

>of Time has already told me the proper sequence for the cards if and when
>I find them... Anything crucial I'm missing, or is it just a matter of
>checking out every dungeon? (Oh yes, I will eventually invoke the snake,
>but I've tried to do it every which way, and I suspect I won't be able to
>do it until I have the mark of the snake).

Yes, when you get all the cards <YELL>EZOCANE.

Make sure you have Exotics before entering. Also, have one person with
a bow. You will see why.... (ha! ha! ha!)

Note to winning: Be ready to DIE! The place is very hard to win. Use
COPYA and backup your player disk so you can save your characters.

Send me mail . . . I L O V E mail

A while back, someone was asking about the Wizardry scenario editor. I have this editor and am willing to share it. Before anyone flames me for piracy let me say that, although I got it from a friend, there is nothing on the disk that indicates that it has been copyrighted (it doesn't even have a title) or that it is the product of any company or individual. I was told that it is a hacker product distributed for free.

The editor is great: it lets you edit maps, monsters, items, characters, treasure tables and encounter tables, and monster pictures. We have created a Wizardry Users Group (W.U.G.) to distribute scenarios developed by members (we currently have 3). The editor is complex and completely undocumented, so we spent many hours figuring it out and have written our own manual. Anyone wishing to join this group can do so by mailing me (FAST- I will soon be off the net) for the details. There is a NOMINAL charge for this to cover costs of disks and photocopies.

I have also written a program that will let you use wizardry pictures in your own Pascal programs. If you are interested in this, let me know.

Oh yeah, if you don't have two drives then you can't use the editor, but can run the new scenarios.

> $12. I think that there must be some truth in the HCF instruction for the

As I have heard it, the "HCF" instruction which is often found in 6800s and
6502s is intended for QA at the factory: the intent is that you feed the chip
the magic instruction, and watch what happens: it is supposed to count on the
address lines, from 0 to 65535, forever. This [roughly] validates the address
drivers as well as much of the internal logic. Those who have been looking
for the HCF instruction on their favorite micros might watch the address
lines to see if this is true.

There once was an article about booting ProDos succesfully on Franklins, and such. Would the person(s) who know how to do this please either post it again or mail to me directly? I have a real Apple, but a weird 16k card, where the F8 ROM is probably different from Apple's. I understand ProDos peeks somewhere > $F800 to see what you've got.

Thanks, in advance

<munch>

Seriously this time .... the 6800 has a similar opcode which is in there for chip testing ... when you execute it the chip goes into a strange mode where its microcode loops cycling its address lines thru the whole address space reading all of memory. The only way of getting out of this is to reset the chip, maybe the HCF instruction is similar?

a reply to the author was sent but this is for those of you who have
similar problems:

The december issue of Byte magaizine pointed out that interaction between
the static rams of standard 80 column cards and dynamic rams on the motherboard
will cause problems. (see Byte , Dec 1984, page A120).

I've been familiarizing mysef with the CP/M world via a Softcard
and Apple II+ combination. As you know, there exist other Z-80
cards which will also work within CP/M. My question concerns
what people call standard CP/M. Given any program written for
the CP/M operating system, what if any changes are required to
adapt it to Apple CP/M ? Is there such thing as a standard set of changes
to be made? What books detail this information?

I can see that if the Apple CP/M is a superset of the standard CP/M
system; then no problems shoud arise unless the program written
specifically for Apple's version is run on a standard system.

DR's version 2.23

I d'ont know if the new version of CP/M from "mom" is a mixed blessing.
It provides 4k more room for the TPA, but has changes things in the
BIOS and DOS . A friend of mine's says that older files are
generally readable under the new system. But ultilities which
modify system dependent parameters will also have to be changed.
For exampble, He can no longer use his existing 'init' file
to set up his "Saturn 128K card" as ram disk under version 2.23.
Is anyone out there familiar with the advantages, diaadvantages, mods
required to existing stuff , etc resulting from the new release.

P.S. Does BDS C run on Apples?

I just got my new Apple //e Enhancement Kit ($70). This is the kit
you've all been hearing about. There is a 65C02, two new ROM's
to replace the CD and EF Monitor chips, and a new character
generator. The 65C02 is from NCR. The character generator
replaces some of the inverse (or flashing?) chacters with
Mousetext icons, for use with Mouse driven software.

The kit says: "gives the Apple //e many of the advanced features
found in the Apple //c, including faster processing, MouseText

character display, and support of interrupts for applications such as networking." A very *THIN* (useless) User's Guide came with the kit. The last page says: if you're a programmer..., for technical details about the //e Enhancement, see About Your Enhanced Apple //e: Programmer's Guide (PN. 030-1143-A), available at no extra cost from your Apple dealer. My dealer doesn't have this yet.

The kit is a dealer-install only. The new (april) issue of A+ magazine has an article on the //e enhancement. The reason they say for the dealer installation is that the dealers have agreed with Apple to get rid of the chips, to ensure that they won't show up in bootleg Apples. My dealer apparently hasn't heard of this policy; he sold me a kit as is when I told him our institute does all our servicing. The article also says that the manual above has the 65C02 instruction set, and listings for the new monitor ROMs.

The new character generator does mess up some things. For example, with Copy][+, when VIEWing files, the inverse text characters come out wrong. However, Central Point knew about that, and in their manual, doing a control-@ sets the characters to flash mode, with normal ASCII characters where the mouse-icons were. I alleviated the problem by just going back to the old character generator, which worked fine with the other new chips.

The article, as well as the new //e Owner's manual, confirm that all new //e's, shipped after the beginning of March, come with the upgrade already in, all four chips.

I bought this kit because of the improved interrupts on the //c. The disassembly I did on the new ROMs is definitely different from the //c interrupt vectors, so I don't know how "improved" this really is. I'll have to wait to get the programmer's manual. This still doesn't seem to do it like Morgan Caffrey's articles have suggested (to eliminate the $45 crisscross with DOS), so we'll see.

Summary:

As far as I have heard, ProDOS looks into the high memory of the F8 ROM
and into the ROM on the DISK CONTROLLER. I was NOT under the impression
that it looked at (or could look at) the details of the 16k card, except
that it existed.
  In order to use ProDOS with an Apple II clone, you would have to either
patch the places where it looks in the cards, or buy gen-u-ine apple
cards. Personally, I think this was not such a great decision on
Apple's part since it will deter the overall acceptance of ProDOS, but
then we've been over this before, haven't we?

Introduction:

     I am about to tell you people how to MODIFY characters for Ultima]I[. This is a very bad to know because from then on you will be un-able to watch a game of Ultima]I[without "helping" by cheating. I am not going to tell all but I will tell how to get at the data.

Part I: getting at the data

     1) If you have a card that lets you stop programs and change the bytes in the middle of a run then you have it easy. Just stop the game while playing the characters you want to change.

     2) If you have a sector editor(DOS 3.3) then do the following. Start Ultima]I[and form a party filled with the characters you want to edit. Then leave Ultima]I[and turn on your sector editor. Put in the player disk and read in Track 3, Sector 7.

     3) When using the card do the changes to the range of memory from $4000 to $40FF. It looks exactly like Track 3, Sector 7.

Part II: changing the data.

     Each character uses $40 bytes to store his most important characteristics. Character 1 uses 0-$3F, 2 uses $40-7F,etc.

     I AM NOT GOING TO TELL YOU WHAT EACH BYTE DOES!!! It is not that hard to figure out.

I will tell you a hint: Before editing your disk, write down all the stats of your first player. He will be in the first $40 bytes. LOOK FOR MATCHES!!! Exp,gold,level,hits,hit max are all two byte blocks. your cards and marks are one byte where each bit tells if you have the card or not. I put $FF here and get them all.

Part III: saving.

     If using card just restart game. A control-Y on a Wildcard if I remember correctly.

If using sector editor just write it out to disk and then
restart Ultima]I[.

Happy gaming.

>   Is there a jester in the castle? I have a hint: "Seek the jester in
>the castle of Fire"
>

There is no use for the jester. I think you have the hint wrong. THere
 is a jester being tortured in fire.

>   I "won" the game by blowing away Exodus in the town next to Lord
>British's castle...the game even said that I had done it all, but I figure that
>only by getting Exodus in the Fire Castle will I have REALLY won.

Hmm. I did not know you could do that. Where in the town?

>
>   Help!   (I have a fighter with +4 bow, and a thief with a bow...of
>course, all have exotic arms/armours...can't see how the bow helps.)
>
>   Ken

Arm all with Exotics Except for one with a bow. THe exotics can kill the
 floors. You use the Bow to find the floors. The bolt from the bow wont
 hurt the floor but the bolt will stop on a floor. I normally get in the
 configuration of:

```
         M
           M M

         B
```

Where the M's are then men with exotics and the B is the man with the bow.
 All will attack foward until you cannot kill anymore without using the bow.

Then the bowmen steps around shooting till the bolt is stoped. You now
 know where the last one is. There are SIX sets of floors. (did
 I explain that well?)

              GOOD luck

Send me mail . . . I   L O V E mail

I have been using Prodos for about ten months now, and have thought the world of it. Up until now..... I have a program called Electronic Design, which runs under normal dos 3.3 when I try to convert any program on that particular disk, I get garbage under Prodos. I thought an easy solution would be to exec it into a text file, and then exec it back, but the lines are greater then 255 chars. (a result of using ? instead of print.) Does anybody know why this is happening? I don't want to have to put it into a wordprocessor, but unless someone knows why this would happen, I'll have to try it.

Thanks.

Lines: 26

I've recently bought an Ultraterm 80-column card for my Apple 2+. It
works with Apple DOS and with CP/M, but Apple Pascal will not boot
with the Ultraterm installed (or even inserted, but with the monitor
cable not connected). This is the case for an Apple 1 disk which worked
fine before the Ultraterm arrived, and also for an Apple 1 disk on which
the file SYSTEM.MISCINFO has the 2 paremeter changes:
   SCREEN WIDTH = 80 (was 79) and HAS LOWER CASE = TRUE (was false)
This latter disk will also boot with the Ultraterm removed.

The full configuration is:
Apple 2+ with 2 disk drives
Amdek Color 1 monitor
NEC PC 8023A-C printer

Slot Usage:
0 = 16K RAM card (Microsoft)
1 = printer interface (Grappler +)
2 not used
3 = Ultraterm
4 + CP/M card ("Starcard 2.0"....the shift mod wire & clip installed
                came with this)
5 not used
6 = dual disk controller (Apple)
7 not used

I would be grateful for any suggestions as to how to solve this problem.

Inscribed within a few bytes of the F8 Rom are the familar words
"APPLE II" ..... in keeping up with their promotional slogan of " forever "
if these bytes (which are use at powerup time to display the above)
is changes to any other fruit (ie. ORANGE II, PINEAPPLE II, or AL BABY II)
Prodos will promptly exit.

FLAME: Bad as Apple's Tech Support Line has been in the past, I had
found it at least marginally helpful for those usual questions
(you know, the one's where that salesperson and the repair person
say HUH?)
     Well, I tried calling it last week, and got only a recorded
message, directing me to the customer service line, where they will
just give you the name of an Apple dealer in your area. I was told
that the Tech Line was disconnected permanently.

All technical questions now go through the salesperson; if he/she can't answer it, *THEY* ask the repair person, and if he can't answer it, he can call Apple. The answer goes back up this chain again. If you've ever played the game Telephone, you know how garbled things get. Plus, you can't carry on an intelligent conversation.

I am totally incensed by Apple's progressively worse customer attitude. I guess Apple is showing they don't care. I know their answer will be that going through the dealer chain is more efficient. Unfortunately, the dealers usually know less than I do, and often can't even comprehend the question.

I have been using applewriter and magic window for some time, and I have come to the conclusion that disk swapping is bothersome. I would like to buy a new word pro. but I am not sure of which one I should get.
I have a Profile, and thats where I want this word pro to go, but should I get Applewriter IIe, or spend the extra and get Appleworks?
If you have used either, please send me your comments about the pros and cons of the program.

Thanks,

Andrew Rahme

<<<<
  I once found a bunch of undocumented opcodes in the 6502 in my KIM-1 by looking for patterns in the opcodes. None of the original 6502 opcodes ended in 11 (as in XXXXXX11). It turns out that executing these instructions would perform both a XXXXXX01 and a XXXXXX10 instruction. For example a A7 would load X from Page Zero (A6) AND load A from Page Zero(A5) at the same time. There were also some store instructions that could OR two registers and store them in memory in one instruction although I hate to think what was going on inside the chip for that one.

  I am sure that if a HCF was a opcode 12 that it must have been a special case instruction. Its class and grouping is what you would have suppected a ASL (ind),Y to be if it existed.

Wanted: how to access the communications port in UCSD Pascal.

I teach a Pascal course at the local community college and we need a
communcation program (written in Apple Pascal--UCSD) that will provide
file transfer from a UNIX system to the Apple. Apple to UNIX would be nice but
not essential.

I have the source of a version of Kermit in C for UNIX.
Would be willing to translate to UCSD Apple Pascal but need to know
how to access the communications port from UCSD Pascal.
Anyone know, or know where I can find out?

Many thanks,
David Custer

RAMBLINGS
By J Fields

I have to stop and jot a note down about the new Macintosh Office System. Apple
Came to town last week (March 14-15) to show it off and it's worth a few
comments.

The system's key points are its simplicity, and ease of use. We had it hooked
up in less than five minutes. Within 15 minutes the laserwriter cranked out the
first near-typeset-quality document. We also observed the Mac XL being used as a
server to five macs, and the Mac Switch program running on a 512K Mac and
allowing more than one program to be 'live' in memory at a time.

I have to be honest though. While the graphics capabilities of the Laser Printer are nice, somehow Apple does not seem to have another winner of Macintosh caliber. Speed seems to be the major drawback. When using the Laserwriter as server to only two macintoshes we experienced significant difficulties and delays trying to print out documents. Trying to print out 2 one page files, and one three-page file I had to fight to keep from falling to sleep while waiting. Such problems are probably acceptable if you need to utilize the maximum capabilities of Laserwriter -- say you are currently paying $25 a page for typesetting. But if all you want is simple letter quality output for a single Macintosh then you might want to hook up via Microsoft's MacEnhancer to a Hewlet Packard Laserjet which prints 8 pages per minute. Such an arrangement offers a factor-of-sixteen speed improvement at half the price.

Another observation: In recent weeks both The Wall Street Journal and Business Week have reported the concerns of market analysts about various leadership problems in Apple. I have to say that I find some cause for concern for the value of my own shares after viewing the six-hour Mac Office presentation. I've certainly changed my investment plans (to buy more while it's 'low' at $21 a share) in the aftermath.

Apple brought to Hawaii, by my count, six (maybe there were more) people to make the presentation. However, only two people were present to make the presentation: a very competent trainer and a technical support person. At the close of the day several other people showed up. Among them, the trainer's boss dropped in to take our temperatures, our marketing representative came by breathlessly at the last minute to hand out a variety of packets with uncertain contents, and the marketing rep's boss showed up to make a few comments before we left (I think I have the people & positions right).

My second observation is more subjective. In my position as a computer sales person (about 3 years) and an assistant sales manager (about 3 months) I've met a number of manufacture's rep's, and I've attended a number of product presentations.

Taking these in reverse order.... The woman who presented The Macintosh Office System to us was very skilled, but by herself the presentation fell far short of the professional quality and impact I've seen in IBM product seminars, although she was more polished than some of the individual IBM speakers I've seen.

The marketing rep puts the icing on the cake. Apple has never seemed to mind the publicity it gets for its cock-a-mamie aproach to business. The idiosyncratic behavior of people inside the company has been reported plenty elsewhere and does not need to be repeated here. However, eccentricity does not excuse bad manners or the disregard for others.

I have the impression that my Apple rep could care less about relationships with important clients. Complaints about unreturned phone calls are met with a cold shoulder rather than an apology. Sales bonus's that are in the mail are in the mail for weeks. Personal conversations revolve around the representative's good fortune and not around client needs. In short, it's up to me to make him rich.

The impression of Apple that I'm left with is that there are several hardworking people in the company, but that their efforts are pretty much cancelled out by leadership that fails, fails to provide good guidance, fails to make good hiring decisions, fails to retain experienced and valuable contributors, and (I suspect) fails to survive largely because it fails to appreciate the needs of others who live outside the world of the executive's hot-tub.

If I have an ax to grind in saying this it's that I've been from the beginning an Apple owner, a fan, and an active promoter in my community. Somehow I sense that I've thrown pearls of time, effort, and sales revenue before swine.

    Awhile back, I posted a request for information on the use of a 65C02 in an Apple][+. Thankfully, several good responses were posted.

    In the latest (March 1985, V8 #3) issue of Call-APPLE, the Apple Doctor column (written by Bruce Field) contained a small article of "other" processors for the][+. Here are some of the "high points" of the article:

    - The 65C02 is pin compatible with the 6502, and has 27 additional instructions.

    - Chips manufactured by different manufacturers are not all the same. For instance, the Rockwell chip has four more instructions dealing with bit manipulation.

    - A given 65C02 may or may not work in an Apple][or][+.

- Two new chips have recently appeared, a 65802 and 65816. These are CMOS chips with 16 bit registers and contain 6502 emulators.

- The 65802 is pin compatible with the 6502, and can be used in any Apple. The author notes that hew was told that this chip will work in a //e, but does not know if it will work in the older][or][+ models. (I suspect that this will probably be the same old **** as with the 65C02 for us][owners. Wouldn't it be nice if Apple INC. would offer processor upgrade kits?)

- The 65816 is not 6502 pin compatible.

- The author notes that most of his information came from "Apple Assembly Line", published by S-C Software, PO Box 280300, Dallas, Tx 75228. (BTW, any comments on this newsletter?)

Dear net.games and net.micro.apple readers:

What follows is a copy of a letter that I sent yesterday to Roe Adams, late of Softalk, and now National Editor of Electronic Games magazine. It is in response to an article in the March issue of that magazine. I have posted it here because I think that it is of general interest to the net, and even

to people in Great Britain. (How about that?) I also posted it here because I'd like to see a discussion of this topic started here, and I figured that this would be a great way to start one. Please, if you have flames about this article, MAIL them to me. Feel free to post useful discussion to net.micro.apple. I do not believe that net.micro is interested. Please note that I may quote your personal mail to me in followup postings, but I will not use your name unless you state that I am allowed to do so in your letter.

And now that that's over, heeeere we go . . .

 . . .

As per the request at the end of the article in the March 1985 issue called "Menace of the Software Pirates," I am sending you this letter to let you know how I feel about piracy. I never expected the article to come out in favor of piracy, but I expected it to be accurate, straightforward, and relevant. Unfortunately, it was none of these things. I have a number of general and specific complaints about the article, and I will outline them here, presented with excerpts from the original article for clarity's sake.

> The advent of disk duplicators has created a new category of computer thief,
> the software mugger.

I have never, repeat, NEVER heard this term 'software mugger' used before. Is it the habit of your magazine to invent silly new buzzwords to make something old and commonplace sound new and interesting? The pirates I know who do nothing but copy things using Essential Data Duplicator or Copy][Plus are still called the same thing: pirates. 'Software mugger', indeed! I am proud to say that I have NEVER mugged a piece of software, or even a human being.

> Ironically, in their lust to obtain the newest software, the vast horde of
> muggers frequently scare software publishers out of the business.

"Frequently"? I have yet to hear of ONE COMPANY that went out of business and blamed software piracy. Perhaps I missed something . . . but even assuming that I did, "frequently" brings forth visions of several software publishers folding monthly, screaming "the pirates did it to us!" to the bitter end. Has this ever happened? I don't think so.

> The British software industry presents a frightening example. Think for
> a moment about all those fantastic British software programs you've enjoyed
> over the years. What, you say you can't think of any? That's because
> piracy has flourished unchecked in the U.K., and no company wants to spend
> time and money creating an innovative program knowing full well that the
> better it turns out, the greater the likelihood that the vultures will
> rip it off.

Granted, piracy in Great Britain is as big as or bigger than it is over here. But the conclusion that the lack of British software available over here is because of piracy is the biggest pile of rubbish I have seen in a great while. The main "problems" are these:

- The British use a totally different group of machines from we Americans. The popular machines over there are the TI 99/4A, the BBC micro, the Oric-1, the Dragon, the Sharp MZ-80A, the ZX-81 (known as the Timex/Sinclair 1000 over here), and the Spectrum (the short-lived Timex/Sinclair 2061). There is some crossover . . . a few C-64's and Ataris, and maybe you can find an Apple if you're lucky, but for the most part, micros that are popular in Britain are either defunct over here or were never even available in the first place. Therefore, there's not much of a market over here for already developed British software. But what about the 64 and the Atari, you ask? Well, that brings up the other problem . . .

- The British DON'T BUY DISK DRIVES. They consider them a waste of money, and from what I've seen there, they are quite satisfied with their cassette tape drives. (That may give them a speed advantage over the disk-drive equipped American user of the C-64 :-) Games that take advantage of the disk drive (which Americans use almost exclusively nowadays) are never even developed, so how could they be sold over here? And it's virtually impossible to sell tape-based games on this side of the Atlantic in quantities that would warrant importing from England.

The lack of British software available over here is a nonissue.

> When it doesn't kill off titles altogether, mass piracy at the very least
> tacks dollars onto the price of software as the producers pay off the high
> cost of increasingly sophisticated copy protection.

They are wasting their money. I know almost as many people who refuse to buy copy-protected software as I know software pirates. Jerry Pournelle, in his BYTE column "Chaos Manor", has gone over this many times, and in a manner much more convincing than anything I could say here.

> Penguin Software . . . has attempted to deal with mugging and piracy in a
> different manner. Penguin, in an altruistic bit of company policy, doesn't
> even bother protecting their applications software, including instead an
> extraordinarily fair replacement policy.

I would hardly consider this policy "altruistic". This should be standard policy for EVERY company. And why, pray tell, are they so generous with their applications software, while they insist on protecting their entertainment software to the hilt? I have seen just as many pirated copies of "The Complete Graphics System" as I have seen of "Transylvania". In my opinion, people who invest in entertainment software have the same right to back-up their disks as people who invest in applications.

> As a final incentive to stop illegal disk duplication, Penguin has done as
> much as anyone to keep the lid on their software prices.

$35 for a graphic adventure is "keeping a lid on their software prices? Give me a break!

> Of course, the muggers' use of high prices as a rationale for illegal

> copying is, at best, a red herring.

As a rationale, perhaps I can agree. The only rationale I have ever found necessary for piracy is the fact that you get free software. That's a pretty good rationale. But the threat of piracy still doesn't justify the outrageous pricing policies going on today on ALL kinds of software, be it entertainment or applications. If Borland International can sell "Turbo Pascal", which is generally recognized as one of the best Pascal compilers on the market, for $70, what does that make the company that charges almost as much for a simple adventure game? Many words come to mind, none of them suitable for a family magazine.

> Moreover, the mugger is more responsible than the company for the high price
> of software. Not only by stealing programs, but by sharing with friends, the
> retail marketplace is diminished. The fewer paying customers there are, the
> higher prices remain.

That most pirates would have bought the software they pirate in the first place is a fallacious assumption. Where would pirates with thousands upon thousands of (retail) dollars worth of software have gotten the money for it? People who would ordinarily buy software still buy it, those who wouldn't buy software anyway, pirate it. As I pointed out before, I haven't heard of any software companies going out of business and blaming the pirates. (And I am of the opinion that piracy has probably kept several floppy disk manufacturers in the black!)

> . . . one particular group stands out as being culpable [for high software
> prices]: the producers of disk-duplication software.
> In homes all over America, otherwise-honest adults and adolescents are
> stealing the products of other people's creative labor. They are doing this
> not for kicks or as a statement of dissatisfaction with the state of software
> prices, they are doing it because it's so incredibly easy!

Software pirates rarely use programs like Copy][Plus or Locksmith 5.0 anymore -- the programs simply aren't necessary. Thanks to current modem technology and that small handful of pirates who can remove the copy protection from virtually any program in a matter of hours, practically any ware you like is available over the phone lines from any one of literally hundreds of software-oriented computer bulletin boards across the country. Once the copy-protection is removed, all you need to copy the disk is the program COPYA, which comes with every Apple sold. As an example, Activision's "Ghostbusters" and Penguin's "Sword of Kadash" are considered "old wares" by most pirates, even though the games aren't even available yet (for the Apple) in most parts of the country. Most pirates have copies of games before ads for the games even appear, without ever having to boot a single "dupe disk".

And what about legitimate owners of protected software? Few companies sell programs with backup copies. Fewer still replace a damaged disk for $5 or less. Remember, current copyright law allows the legitimate owner to make a backup copy of the original disk.

> EG'S 4 POINTS . . . how the industry should address the question of piracy
> and mugging. The following are our suggestions:

>
> 1) The computer industry must use all its influence and power in an effort
>   to have all copy-duplication software banned. No one has a legitimate
>   use for a dupe disk, any more than they do for a machine capable of
>   duplicating currency. As long as there are dupe disks, it will be so
>   easy to steal software that great numbers of people will be unable to
>   resist.

So, making backups isn't a legitimate use for a dupe disk? Tell that to the manager whose "Accounts Recievable" program disk has just been wiped out by a stray cup of coffee. Hey, as long as there are cassette decks, it'll be so easy for folks to tape albums for their friends that great numbers of people will be unable to resist . . . better ban them, too . . . and as long as there are cars able to go faster than 55 miles per hours, lots of folks will be tempted to break the speed limit . . . This suggestion reeks of Big-Brotherism, and I am totally appalled that you would suggest the banning of ANY kind of software.

> 2) Newspapers, magazines, or any other medium carrying ads for dupe disks,
>   pirated software, or other piratical devices must be boycotted. This
>   also applies to bulletin boards and even user groups through which
>   pirated software is produced.

In the first place, you've described just about every computer-oriented magazine on the racks, secondly, virtually nobody is going to boycott a magazine just because it has ads for Back-It-Up III, and thirdly, just who do you think are MEMBERS of user groups that distribute pirated software? Innocent little old ladies from Pasadena?

> 3) The software industry must set standards in the matter of warranties.
>   Guidelines must be agreed upon so that defective software can be
>   returned in a manner equitable to both the manufacturer and consumer.

Agreed! The days of "The manufacturer of this product doesn't warranty it to do jack-poo, and accepts no liability in any way, shape, or form for any damages that result from any use of this product no matter what happens" have got to end. (This has nothing to do with piracy, though, so what's it doing here?)

> 4) Finally the computer industry must get it together . . . Piracy is
>   a question so crucial to the entire eco-structure of te computer
>   universe that it can not be settled by having each company seek out
>   a separate peace.

Just what the heck does this paragraph mean? Are you suggesting that software companies sign treaties with pirates to prevent the pirates from copying their software? Please clarify . . . I honestly don't have any idea what you're talking about.

At any rate, this concludes my list of complaints about the article and opinions on the subject in general. I hope that this letter will be of some help to you.

What follows is an excerpt from issue 9 of Hardcore COMPUTIST, a magazine that due to its controversial subject matter (defeating software copy-protection) is not available everywhere. This issue in which this appears is also out of print. It describes a technique that should allow persons to use ProDOS on an Apple compatiable.

Using ProDOS on a Franklin Ace

The March, 1984 issue of Apple Assembly Lines contained a short article containing instructions on how to successfully boot ProDOS on a Franklin Ace computer. Thus method involved NOPing two bytes in the PdoDOS system file after it had been loaded into memory. However, this method would not work for the ProDOS file dated 01-Jan-84.

The ProDOS system file contains a checksum-like routine which returns a value of $0C if a genuine Apple is detected and a $00 otherwise. If a non-Apple is detected ProDOS will just hang up and not load in the BASIC.SYSTEM interpreter.
 . . .

In order for this routine to always return with a value of $0C, the branch to the code which loads the accumulator with $00 (LDA #$00) needs to be removed. This can be done by replacing the BNE $2660 (D0 03) instruction with two NOPs (EA EA).

The easiest way to do this is to use a sector editor and zap the change directly to the disk. Any sector editor can be used on a ProDOS disk because the formatting has not been changed from DOS 3.3. On my copy of the ProDOS USERS DISK the change I had to make was to bytes $5B and $5C of Track $01, Sector $09. I changed them from D0 03 to EA EA and rewrote the sector.

If you have a sector editor with search capability, such as ZAP [from the disk "Bag of Tricks", by Don Worth and Pieter Lechner of "Beneath Apple DOS" fame], you should search for a byte sequence of 69 0B D0 03, since the sequence of D0 03 is a fairly common one.

Once you have made this change, ProDOS should boot and operate on Franklins and other Apple compatiables that have their monitor ROM routines in the proper locations.

I hope this article helps. I have not had to try it, because I bought a REAL Apple. I would suggest that the serious user do the same.

Anyone running MICROSOFT's Multiplan on APPLE II+ CPM with a PCPI Z-80 card (aka Starcard)? What 80 column card are you using?

Do you need a special version to run on a non-MICROSOFT Z-80 card?

I am running a FRANKLIN ACE 1000 with a PCPI Z-80 card (Z-80B) and WESPAR WIZARD 80 column card and am interested in purchasing a CPM spreadsheet.

Thanks in advance,
Paul M. Hudy <egapmh@ecsvax>

Has anyone out there used/bought/heard-about the 10mb hard disk being advertised by First Class Peripherals?? It is called the Sider and sells for $695. It is supposed to be compatible with all the standard Apple Operating System options- (ie. DOS, CPM, UCSD). It sounds nice, but was wondering if it met all its claims, as well as power supply requirements/problems, etc. It sounds like it might be a nice addition to my FRANKLIN system.

Thanks in advance,
Paul Hudy <egapmh@ecsvax>

In his article concerning alternative Apple processors, Joe Loda wrote:

> - The author notes that most of his information came from "Apple Assembly
> Line", published by S-C Software, PO Box 280300, Dallas, Tx 75228.
> (BTW, any comments on this newsletter?)

I've been subscribing to Apple Assembly Lines for over 3 years now;
it is a newsletter aimed at assembly language programmers, particularly
those using the S-C Assembler. I happen not to use that assembler,
but I still find enough good articles to justify the subscription.
It is published monthly by Bob Sander-Cederlof (hope I spelled that right,
Bob!).

The articles mainly deal with tricks for improving the performance/capabilities
of the S-C Assembler, in addition to more generic discussions of algorithms
and code for performing functions in assembly language. And some industry
gossip is thrown in for good measure.

The newsletter is definitely not for the neophyte, but is worth considering
by the serious assembly language programmer.

DISCLAIMER: The usual stuff; also, I am not connected with S-C Software
or Apple Assembly Lines other than as a satisfied subscriber.

a
 I would like to print 12 characters/inch on my epson mx80 when doing
word-processing with applewriter, or circascript word processors. Is it
possible?

 I tried using 'Sideways' which prints a 'visicalc' format sideways on the
Epson, at 12 CHARACTERS/INCH and it looks so good that I want 12 (or more)
in the regular print mode too.

 Any suggestions sincerely appreciated.

[]

I'd looking to upgrade my Apple II+ with a CP/M card,
and would like recommendations on the best card to buy.
I've heard some cards use the Apple's memory, while others
have their own RAM (and thus can chug along at clock rates > 1MHz);
is the cost of the extra RAM worth the increased performance?
Also, will the card work with the Apple //e as well?

Finally, has anyone heard about a product for adding CP/M
to the Apple //c? I've been hearing rumors that such a product is/will be
available, but can find no specifics about it.

Please reply via e-mail to me at:

One possible fix to your problem is to decrease the size of the scrolling
area. The fundamental problem is that it takes a long time for the poor little
old 6502 to scroll all those characters when it gets a line feed, and it
does not poll the Super Serial Card for incoming characters while it is
doing the scroll. I have a *real* terminal emulator that does scrolling and
polling at the same time. I am very happy with it. I have it on beta
test right now, but the author may make it
available to the world sometime soon. Because of this fact, I have not
tried out the proposed fix, but it was given to me by someone who claimed to
have gotten it from Apple Tech support. For what that's worth. My source
claimed that just decreasing the size of the scrolling area by 'a few' lines
did the trick at 1200 baud. A 20 line screen that handles 1200 baud is
better than a 24 line screen that doesn't, I always say.

In fact, the Apple Super Serial Card even does not support the protocol for interrupt priority as written down in the //e reference manual. However, if you have only one interrupting card, and that is your Super Serial Card, (The most likely competition would be a clock card, and if you have a clock card you dont need to have the SSC interrupt, because you can ask the clock card to interrupt once every 4 ms or so, and poll the SSC in the clock service routine.) then the protocol is followed by default.

For what it's worth. The above inforamtion can all be gleaned by a careful reading of the SSC reference manual and the //e reference manual. It's all there, you just have to know where to look.

All that is needed is usually a jumper between two of the fingers
on the card's edge connector.

***** Slight Spoilers *****

Just bought a game by SIR-TECH called WIZARDRY. (First Scenario: The Proving Grounds of the Mad Overlord.)
First, by way of review, I must admit that the first time I plugged in the disk, I played for 11 hours straight. It's that good. My only gripe is that no matter what message is displayed in the what's-going-on-window has an exclamation point after it!
As for tips, I can only offer this time-consuming one: When in desparate need of cash, go to the training grounds, create some suckers, bring them back to the Tavern, get them drunk, steal their money, take them back to the grounds and slaughter them mercilessly. An infinite amount of gold is available in this way.
But, I do have some questions for anyone reasonably familiar with the game:

- What level do my characters have to be to bring them into the second scenario?
- What good are those silver keys you find near the boar statue in the secret 1x1 room on the first level?
- Where does the Private Elevator (Use Button D and go to end of hall) take you? I've never had a gutsy enough party to use it.
- Is there any way to regenerate HPs without using up spells or leaving the maze?
- My game generates 80-col mode letters (with spaces between) when I'm not in the maze even using ESC CNTL-Q (to disable the 80-column card on my //e) under DOS before booting it. Can I do anything about that, short of physically yanking the card?

- I found the Control Center but can't control anything, what do I need
  to do?

Thanks in advance.

>   scenario?

 There's no definite answer, but it would be good to have your spell
 casters at at least 13th level so they can cast seventh level spells.

>   - What good are those silver keys you find near the boar statue in the
>   secret 1x1 room on the first level?

 I don't remember; they get you into some place on second level,
 I think.

>   - Where does the Private Elevator (Use Button D and go to end of hall)
>   take you? I've never had a gutsy enough party to use it.

 That allows you to go to levels 5-9 easily (you can't take an elevator
 to level 10).

>   - Is there any way to regenerate HPs without using up spells or leaving
>   the maze?

 Not until you get some of the "special" magic items.

>   - My game generates 80-col mode letters (with spaces between) when I'm
>   not in the maze even using ESC CNTL-Q (to disable the 80-column card
>   on my //e) under DOS before booting it. Can I do anything about that,
>   short of physically yanking the card?

 You got me.

>   - I found the Control Center but can't control anything, what do I need
>   to do?

 You're not supposed to do anything except kill, Kill, KILL!

 The second scenario is definitely better than the first. Battle has
been slightly modified (you can't spell on a surprise round), and
some spells work (like katino, manifo, montino, and latumapic) that
don't work well (or at all) in the first scenario. I've played a
little in the third scenario, and it looks OK, too.

 Hope you're satisfied.

     - sam black
         [alias POOPH the samurai (level 27, 233 HP)]

Sir-Tech (or somebody) recommended 13th level or higher just to survive.

> - What good are those silver keys you find near the boar statue in the
>   secret 1x1 room on the first level?

Don't remember precisely, there are many passages which can't be entered without certain items.

> - Where does the Private Elevator (Use Button D and go to end of hall)
>   take you? I've never had a gutsy enough party to use it.

Why, to the 4th floor. A Blue Ribbon is needed to operate the other elevator, which has access to levels 4-9 (getting to 10 takes minimal effort, but lots of luck.

> - Is there any way to regenerate HPs without using up spells or leaving
>   the maze?

Nope.

> - My game generates 80-col mode letters (with spaces between) when I'm
>   not in the maze even using ESC CNTL-Q (to disable the 80-column card
>   on my //e) under DOS before booting it. Can I do anything about that,
>   short of physically yanking the card?

Ditto. This is a bug in the runtime pascal...it triggers 80 columns and on a //e, this simply alternates page 1 with alternate memory.

> - I found the Control Center but can't control anything, what do I need
>   to do?

Don't remember precisely (finding the elevators makes life simple) but it didn't seem too useful a room at the time.

For really desperate and bored players, a now famous bug is to create a bishop (generate oh, say 27 or so extra points to distribute, and load

up intelligence, wisdom, and piety), go into the dungeon, and try to
identify item 9. (yes i know, there are only 8 items) When you succeed
(you will eventually) you get 1,000,000,000 (give or take a few zeros)
experience, enough (typically) for well over 100 levels. This cheat
recommended only for people who want to mess with, oh, say the Tiltowait
spell (small nuclear explosion, only affects monsters).

Good luck, and watch those teleporters.

> First, by way of review, I must admit that the first time I plugged in the
> disk, I played for 11 hours straight.

I wholeheartedly agree, when I first got Wizardry, I played at least
20 hours a week.

> - What level do my characters have to be to bring them into the second
>   scenario?

Level 14 is a useful minimum, but I find it really depends on the
characters' abilities and their types.

> - What good are those silver keys you find near the boar statue in the
>   secret 1x1 room on the first level?

Keys, statues, ribbons, and similar things are actually the "passports"
into various sections of the dungeon. If you don't have them, then you
cannot enter either because of a lack of strength, poisonous gas, etc.

> - Where does the Private Elevator (Use Button D and go to end of hall)
>   take you? I've never had a gutsy enough party to use it.

Levels 4 through 9.

> - Is there any way to regenerate HPs without using up spells or leaving
>   the maze?

No.

As you get to handle deeper levels, money will become no problem.
You can also cheat a bit through use of backup & transfer to get
extra copies of good items and more money.

> - What level do my characters have to be to bring them into the second
>   scenario?

The second scenario is packaged separately and says what level you need.
I think it was 13th.

> - What good are those silver keys you find near the boar statue in the
>   secret 1x1 room on the first level?

Gold/Silver/Bronze keys and Blue ribbon each get you into places you
could not otherwise go.

> - Where does the Private Elevator (Use Button D and go to end of hall)
>   take you? I've never had a gutsy enough party to use it.

The elevatorS take you to different levels. The one you mention gets to
level 4 when you press D.

> - Is there any way to regenerate HPs without using up spells or leaving
>   the maze?

I don't think so.

> - My game generates 80-col mode letters (with spaces between) when I'm

Hey, how do you get to level 10?
I've been trying to acquire a teleport spell
but if there's an easier way I'd like to hear about it!

Keywords:apple visicalc spreadsheet

I would like to kludge up a sort command for
advanced visicalc(apple III version). It
would also be nice to have a way to override
cell divisions when writing headings etc.
Please mail any suggestions or, better yet,
solutions you may have. Thanks.

> - What level do my characters have to be to bring them into the second
>   scenario?

  I have no idea, I have never played the second one, but I am sure that
  after finishing, the characters will be high enough.

> - What good are those silver keys you find near the boar statue in the
>   secret 1x1 room on the first level?

  It has been awhile, but I remeber using them on a door somewhere on
  2nd or 3rd level.

> - Where does the Private Elevator (Use Button D and go to end of hall)
>   take you? I've never had a gutsy enough party to use it.

  It takes you to the lower levels. It is the main way to get there.
  There are ways to go down using stairs (I haven't found them all) but
  the elevators are quicker. If you get to the fourth level and (ahem,
  slight spoiler) get your pass, then it is assumed, you can handle the
  lower levels. This way you can skip levels 2-8 if you are a 15th and
  higher level character and get right to the nitty gritty. Going down
  beyond your level of competence and defeating higher level monsters
  will give you lots of experience (relatively speaking) but is
  dangerous.

> - Is there any way to regenerate HPs without using up spells or leaving
>   the maze?

  No, not to my knowledge.

> - I found the Control Center but can't control anything, what do I need
>   to do?

  I don't think anything can be controlled since the front panel operators
  obviously have to be wiped out before you can enter.

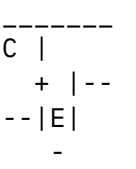
OK...I'll tell you...first, don't muck around with a teleport, I seem
to recall having trouble on level 10 with it (seems to usually end up
in rock, although the map doesn't appear that way)

and now the answer to level 10...how you get there...

from the elevator on level nine, there is a room to the left. Go in.
this room is 2x2, and the corner of the room diametrically opposed to the
first entrance is a chute to level 10. When you arrive, there is a cute
little message, and a teleporte behind you back to the castle. Of course,
there is a hallway in front of you, and a most annoying set of teleporters.

Map:



more ore less. add a few doors and that's it.
G'luck

>back to the grounds and slaughter them mercilessly. An infinite amount
>of gold is available in this way.

A much better way is to give all the money and the most valuable objects to one or a few people. Back them up a new disk. Put them on another scenario disk. Change their names. Transfer them to the original disk. Now you can repeat this process and create unlimited amounts of money, armor, etc. The only thing you can't do is transfer characters with nontransferrable items. To save time, you can keep backing/renaming/transferring until you fill a disk with characters.

>- What level do my characters have to be to bring them into the second
> scenario?

Its in the ducumentation. I seem to remember 11 or 13 is recommended.

>- What good are those silver keys you find near the boar statue in the
> secret 1x1 room on the first level?

They get you into doors on the second level that you normally can't get through.

>- Where does the Private Elevator (Use Button D and go to end of hall)
> take you? I've never had a gutsy enough party to use it.

Levels 5-9. Then on level nine, there are two trapdoors to take you to level 10, but beware, AIR GIANTS kill with one hit.

>- Is there any way to regenerate HPs without using up spells or leaving
> the maze?

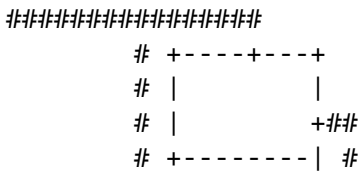
I like using up all my healing spells remaining just before i leave the maze. If I don't completely heal everyone, go to the in but only sleep in the barn one night (A) . Then reenter the maze, heal some more and exit.

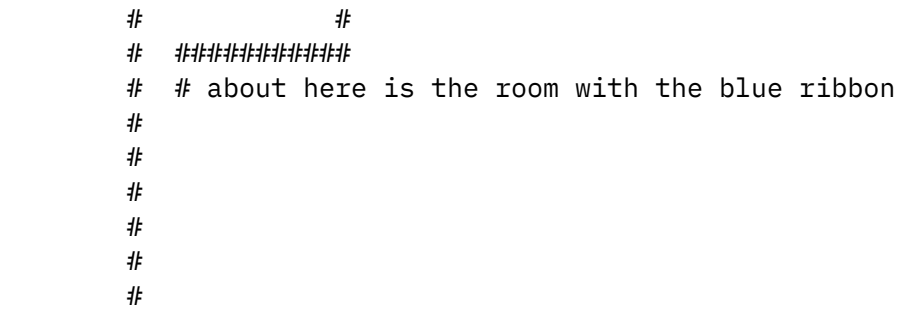
>- My game generates 80-col mode letters (with spaces between) when I'm
> not in the maze even using ESC CNTL-Q (to disable the 80-column card
> on my //e) under DOS before booting it. Can I do anything about that,
> short of physically yanking the card?

don't know.

>- I found the Control Center but can't control anything, what do I need
> to do?

The control center is on level 4, right? I haven't played this lately, but if the control center is up and to the right, do through to the rooms with the slamming doors and get the blue ribbon. This enables you to get onto the elevator.





about here is the evelator to levels 5-9

****
* *
* MAC USER'S GROUP MEETING IN ROCHESTER NY. *
* *
****

There will be a Mac User's Group Metting on February 5, 1985
at 7 pm. on the Rochester Inst. of Technology Campus, in Building
10 (Comp. Sci.), conference room 1124.

For further information regarding agenda or other concerns,
please call (716) 227 - 7884 (Business) Roland Barner jr.

Anyone interested is welcome !!!!!!!!!!!!!

PS.: If you can not make it on next Tuesday, the meeting takes
place on each first Tuesday of the month in the same location
at the same time (until further notice!).

I wish to sell my Passport Design Keyboard, Mountain Music System with Software
including Notewriter, Music Tutor, Performance software (4 tracks) and
Turbotraks (16 tracks). All in original box, and with original documentation.
Everything is in perfect condition. I am asking $1200 for the lot or
best offer. It works on all revision Apples (I have a Rev. 6 board).

Also, I have a three voice ALF card for sale with standard software for $120.

Not quite. This is true if the card in question does not need to ever
send an interrupt of its own. Then all it has to do is jumper the
daisy chain to pass the 'interrupt is allowed' on to the next lower
numbered card. However, if the card wishes to present an interrupt of
its own, it must have sufficient smarts to provide the
jumper-equivalent when it is not presenting an interrupt, and to open
the jumper when it presents an interrupt and reclose it when the
interrupt is acknowledged by the CPU (usually a soft switch to reclose
the jumper) In this way, if all cards that present interrupts follow
the protocol, then there is full protection against lost interrupts
because of race conditions. This is all described in the Apple IIe
reference manual (pages 131 and 170-171). There is one further
requirement, all slots must be filled (at least with a dummy card that
has the jumpers on it) above the lowest numbered card that wishes to
be able to present an interrupt.

The catch to all this is not the jumpers (that is fairly easy to do).
The catch is that the Super Serial Card, while it has a switch to
enable interrupts from the ACIA, does not follow the daisy chain
protocol. It presents its interrupt when it has one, regardless of
the state of the incoming daisy chain and does not open the jumper
for the benefit of lower numbered cards. There is some consolation in
the fact that at least it does have the jumper in place, so as long as
you leave the 'interrupt enable' switch off, you can use it with other
cards that do follow the protocol.

The upshot of all this is that, if you want to use the interrupt

capability of the SSC, you will not be able to use the interrupt
capability of any other card you may have.

Does anybody know of any simple mods to the SSC that fix this bug?
Does Apple intend to fix it in later rev of the SSC? It would be real
nice to be able to use the SSC under Prodos with interrupts enabled
and a good interrupting clock card at the same time.

In answer to your questions, to the best of my knowledge which is admittedly limited :

1. Suggested level of play for the Second Scenario is at least 12th level. 14 or better would be my personal minimum...

2. Possession of the Keys allows access to various treasure rooms and treasures.. (It's been a while... but take it from me, you need em..)

3. More Monsters.

4. If you find an answer to this one I'd like to know. I usually end up growing old fast over this one (literally).

5. Suffer. On the IBM-PC you don't have this problem. (I'm familier with both).

6. As far as I know, there is nothing to control, you just hack-n-slash your way in here and get mucho points.

When you get to level nine on the elevator. I believe the left
door leads into a 2x2 room. Wander around in this room and you will
fall down a chute to level 10. Level 10 contains among other things,
a lot of little 1x1 alcoves. If you step into one, you go back to
the castle. Level 10 is tough. Good luck.

DRAGON FLEES!

Thanks to all who responded to my WIZARDRY questions. All the help is
greatly appreciated.
Thanks especially to David Hyde of UCLA CS to whom I can't seem to get
mail through. His suggestion about backing up my scenario as I play was
brilliant; I somehow overlooked this obvious and time-saving step.
And thanks from Dreffecken the Evil Dwarf Priest (Level 7; 59 HP).

  There is a chute down to the tenth from the ninth level. But beware,
  there is an obstacle in the way such as a teleport trap or somesuch, I
  don't remember which. However, if you do find it, it is easy to go to
  the tenth level without meeting any monster.
  Someone said earlier to ignore the graffiti on the first part of the
  tenth level, but I feel that if you decipher it, it will save you a
  lot of time. If you take a wrong path you get teleported back to the
  beginning (but this fact is not obvious until you try to map the
  seemingly endless maze).

I answer the original questions about WIZARDRY in the net.games.frp notesfile, so I won't go into it here. However, I believe a clarification of the entrance to 10th level (NOT level G, you dimwit!) is necessary.

TELEPORTING: It is possible to teleport down there. However, unless you have already mapped the 10th level (done by teleporting UP from it using a MALOR spell to a totally nonrock level [6th is good]), I wouldn't recommend it. The passages of level 10 are all disjoint, available by teleporting tiles in the various rooms. I don't remember where all of the rooms and corridors are, but Werdna's lab is in the SE (17-19 E, 0-2 N) corner of the maze.

TRAPDOORS (CHUTES): There are two chutes that take the party down to 10th level. One of these chutes is near the elevator landing (directions were given by another user). The other is in an area of 9th level attainable only by a teleporter chest or other teleport method (no, I don't remember its coordinates). It is recommended to use the one in the room by the elevator.

A few monsters to beware of on 10th level:

- Air Giants: These f**kers are MEAN!!! They hit harder than a blade cusinart' and can cause critical hits like a ninja. Most spells won't work against them (the same for all giants), but LAKANITO and TILTOWAIT have proven to be the most effective.

-Poison Giants: These suckers have the worst case of bad breath in history!!! They have a breath that's sheer poison - literally! If any character misses his/her saving throw against poison (which is based upon your attribute totals - the book never says exactly how this is done), that character is dead! Even if they make the saving throw, the damage is still tremendous.

I lost over half my party the first time I encountered one of these mothers. The same spells mentioned for Air Giants are good for these babies.

-Greater Demons: Hell comes to you!!! These devils are powerful! They shoot spells which would make Merlin jealous and have over 100 HP on the average. Best advice - Fighters jump 'em with a TILTOWAIT or LAKANITO support.

-Vampire Lords: These b**tards are the personal guard of Werdna, the evil arch-mage. Though the number encountered varies, it is typically around 4-8. There are always two groups of them to worry about. They shoot high-level spells and drain TWO or THREE levels if they hit someone. Best advice - use a TILTOWAIT. LAKANITO sometimes helps, but it always seems to miss one or two of them.

-W E R D N A: The big baddie himself! This is an arch-mage to end all arch-mages! However, to get the amulet to successfully complete the mission, he must die! Best way to do this is to have the priest in the party shoot a MABADI spell (leaving this sucker with only 1-8 HP) and have a fighter hit him to finish him off. You have to be lucky in the first place, though, and get him before he gets you. He AVERAGES 80 HP taken off each character with just one spell. If he surprises you, you're finished! If you surprise him and his entourage, do as I have said and he is dead along with maybe half or more of the vampire lords. If neither group surprises the other, pray that yu get your spells off first.

Final note: Killing WERDNA enables you to get the amulet. Take this baby back up with you to the castle to be named a Chevron. This is a good title as it automatically gains you 250,000 experience and automatic first attack against any monsters (though this first-attack bonus may only work in the Proving Grounds. I can't remember whether it extended to Knight of Diamonds or not. Also, this first-attack is only true of fighters and fighter-types. Spells still take awhile to cast). However, there are two disadvantages. One is that the amulet is automatically removed when the party returns, so that only that party becomes Chevrons, and Two is that you lose all of your equipment and most of your gold. My solution: before going down, give all your gold to a neutral character who is not part of the party. This way, you still have the gold with which to purchase items from the Trading Post. By this time, sold treasure items (you have been selling treasure items to the trading post, haven't you?) will have raised Boltac's stock up to levels almost equivalent to the equipment lost. A few treks to the ninth level to open some chests should restore the rest.

I hope these remarks clear up any confusion and help you out!

Just a bit of news for Megamax fans...

They will soon (next couple months probably) have a cross-compiler
available for UNIX. I don't know how it will be distributed.

Many moons ago, I posted a request for music-related Apple 2 software. I
was most interested in copyist's tools, programs that dealt with written

music, but I posted a general request to see what it might bring. I didn't get very many responses, but here's the summary:

Valerie Polichar (sdcc3!valerie) referred me to the AlphaSyntauri, a syntheisizer.

Kaare Christian (cmcl2!rna!kc), whose wife had just completed a survey for *The Computer Buyers Guide*, sent the following:

My wife has three suggestions:

Music Construction Set from Electronic Arts.
If you point at the key box and hold down the selector on your pointing device the key names will scroll by. When you let up, the given key will be selected and the computer will automatically transpose the current composition to that key. Sounds Neat!

Songwriter from Scarborough Systems
It claims to be able to transpose, but I don't know any details. Songwriter displays a piano roll instead of a staff, so it is easy for novices but may not be appropriate for the cognoscenti.

A program called Envelope Sharper from Rainbow Systems works in conjunction with their Music Composer program. Both programs require the MMI DAC board. ES claims to do whole octave transpositions.

Kenn Barry (dual!ames!barry) also wrote to refer me to a synthesizer (I don't seem to have a copy of his letter, so I can't quote it).

Wall Street Journal (So. Calif. edition), Feb 7, p. 44:

Apple Computer Co-Founder Wozniak
Will Leave Firm, Citing Disagreements

CUPERTINO, Calif. - Steve Wozniak, the brilliant maverick co-founder of Apple Computer Inc., is leaving the company he helped start in a Silicon Valley garage eight years ago.

Mr. Wozniak said he will remain on Apple's payroll as an engineering consultant, but that he will be devoting most of his time to a new venture, developing home-video equipment.

He said his departure was prompted in part by bitter disagreements with Apple's management over the company's direction and by frustration with the rigidity of a big corporate bureaucracy.

...

Mr Wozniak said the Apple II, which was responsible for the company's instant success, "has been ignored in the hope that it will die and go away ..."

John Sculley, Apple's president and chief executive officer, would only say in prepared statement that the Apple II family of computers "are a mainstay of Apple's busines and will continue to be a very high priority in years ahead."
[Translation: "It's a cash cow." -- Ed.]

...

... "I want to go back to the garage where you don't have to fill out a dozen forms to get something done," [Wozniak said.] ...

... [Wozniak] is one of the company's largest shareholders, with 4% of its stock valued at about $70 million...

I am sorry if you have seen this notice before; as far as I could tell, it did not get out.

--- Jim

==========

My mother is a public accountant who uses an Apple][+ for her work. Her main accounting program's disk was recently scrogged, and she has been unable to find a new copy of the disk at any local store, nor at several places in Manhattan which she has tried. The company does not even answer its phone (definitely not a good sign)!

Anyway, to get her through the next month or two, until she can acquire and learn a new software package, and re-enter all her information into the new files, she is looking for a good copy of the old program. Does anyone out in netland have one, or know where she might find one?

Company: BPI Systems, Inc.
Software: General Ledger, version 1.8

Just write to me with any info. Or, if you prefer, you may contact her via USSnail or MaBell:

Ms. Delaine Heliotis
Heliotis Associates
195 East High Street
Somerville, NJ 08876
201-722-1576

Thanks for your help.

Jim Heliotis

I am posting this for a friend...

Press Release:

Free the ROM 64 announces the availability of MacNosy, "The Disassembler for the rest of us", on 512K Macintosh and 1 Meg Lisa systems. MacNosy is an interactive disassembler that enables MacDevelopers and MacHackers to recover source code of any Macintosh application file, ROM, or "code" type resources on the "System" file, etc. MacNosy includes features to:

* Automatically subdivide a program into procedures and referenced data blocks.
* Reformat data into its "natural format" via commands.
* Selectively view procedures, code segments and resources by name, etc.
* Direct dissassembled output to a file for inspection or assembly.
* Produce reference map for procedure names, trapnames, etc.
* Search a file for references to selected addresses, trapnames, strings, etc.
* Play back previously recorded journal files (e.g. "scripts").
* Suspend execution until a later time.

The listings generated by MacNosy contain symbols for the procedure names, data areas, trapnames, system symbols, and local labels within a procedure.

MacNosy is availble for $50.00 direct from:

Steve Jasic
c/o Free the ROM 64
343 Trenton Way

Menlo Park, CA 94025

Dealer terms and site licenses are available, contact Steve Jasik
for details (415) 322-1386.

Users of MacNosy should have a knowledge of programming and assembly
language.

Public Domain Review
By J Fields

With this article we begin a new series of articles to replace the old,
sometimes-rambling Ramblings column. Each month we will try to review
something from one of our various public domain libraries. This month we will
start out with Washington Apple Pi's SigMac DiskJ#1 for the Macintosh.
SigMac Disk #1 contains free modem programs, entertaining and educational
MicroSoft Basic(demo programs, and several utility programs.

Modem programs include:

MacTEP(by Dennis Brothers): All the software you need to turn your Mac into a
telecommunications terminal. It even includes the pin connections for the

cable to attach any modem to the connector on the back of the Mac. This is version 1.81, which includes support for auto-dialing with modems that have that feature. Other features include file uploading and downloading with a special download mode designed just for basic programs. Don't wait for MacTerminal; telecompute today.

Real Mouse MacTEP (by Dennis Brothers and Loftus Becker): Loftus Becker took MacTEP version 1.81 with all it's great features and made it even better by adding mouse control of all the menus.

Mouse MacTEP Loader: Run this program to load and run Mouse MacTep. This program clears out more memory so Mouse MacTEP can have enought room to load. This uses the space that the desk accessories normaly, use so they become unavailable. Oh well, you can't have everything in only 128k.
Demo programs provide excellent insights into how to optimize your own programs. They are also entertaining to play with. Try altering different statements, or using Mac's cut & paste capabilities to add these new features to other programs. Demonstration programs provided on SigMac Disk #1 include:

Animation (from ST.MAC March 1984): Some animation technics in MS-BASIC.

Clear Screen (by Anthony Anderson): A little routine to clear the entire screen. If you need the locations of the hi-res screen here they are.
Eliza An all-time favorite. You play the paitient and your Mac plays the doctor. In this demo your computer takes on the role of a psychoanalyst. Computers do say the darnest things.

FLASH(by Ron N.): This little routine is good for a cheap thrill and a short lesson in setting up and calling a machine code routine from MS-BASIC.

MacArt (by Steven Medwin): Select up to ten windows on your screen and sit back an watch. This routine creates windows of kinetic string art.
MacGlobe (by Karl Koessel, Andrew Tuline, and Christopher Allen)Learn how to animate with MS-BASIC or just impress your friends with this 3D rotating globe. Plus, it moves under mouse control.

MGLOBE.DAT (by Karl Koessel, Andrew Tuline, and Christopher Allen): The screen data for MacGlobe. If removed MacGlobe will recreate it, but it takes 20 - 25 min.

Menu Demo (by Loftus Becker): A good look at how to implement a mouse based menu system.

Mouse Demo (by George Acton): Take a look at how MS-BASIC allows you to read the mouse location and the state of the mouse button.

Utility programs include:

DiskDump(by R.H. Nicholson): If you're a programmer, you have probably wondered what secrets are hidden out there on that little 3.5" disk. Well, now you can know what's there in all its gory hexadecimal detail. This program allows you to look at any of the 800 or so blocks on the disk. Share your discoveries with the rest of us in the form of a MacWrite document.

Disk Dump II (by R. H. Nicholson): Like the Disk Dump above but allows for the output to go to the printer, screen, or a disk file.

LstFix Sets the font and size for the list window in MS-BASIC.

MacCopy(by Dennis Brothers): Allows you to append or copy text files. The program can output to any device so it can be used to print files also.

MacWidth (by Dennis Brothers): Copies a text file making the line length conform to a new value. Also gives a count of the words and lines in the new file.

MakeWrite (By Dennis Brothers): This program will change a text file to a MacWrite Document file.

SHAPE (by Mike Cohen): This program allows you to draw with the mouse and save your creation to the disk. The saved file can then be used later by another MS-BASIC program to load an array for screen display.

Text Editor (By Loftus Becker): A text editor for ascii documents. If you don't know what an ascii document is you are not ready for this program yet. Can not be used on MacWrite files.

Also included on the disk are several useful or fun-to-read documents. Program Notes gave me much of the information you see indented in the text above regarding the uses of the disk files. Also included are the following:
1984 script The full script of the commercial that made millions sit up and take notice of the machine destined to make them sit up and take notice.
Mac Error List The complete unexpurgated list of all the things that your Mac can do wrong. We hope you never need it.

QDraw Notes I: Those with MS-BASIC most likely have noticed by now Appendix E of the manual. It lists the calls to the Macintosh ROM routines but that is all. No description of their function, no examples--just a reference to an unavailable Apple manual. Well, here are some of the details that Microsoft left out.

QDraw Notes II More of what Microsoft left out.

RS-232 PINS Want to make a modem cable or hook up your video digitizer? This document details where to connect the pins.

This is from issue #16 (latest issue; orange cover) of Hardcore COMPUTIST:

"Who wants a 65C02?"

Hardcore COMPUTIST is planning to make a volume purchase of 65C02 micro-
processors should a sufficient number of readers indicate that they would
like to purchase one of the chips. The main advantage of a 65C02 is an
enhanced instruction set.

The 65C02 processor from NCR is being used in the Apple //c but can be
substituted for the 6502 in Apple //e's. Apple][and][Plus owners can
also utilize the 65C02, but may have to replace two 74LS257 chips on the
motherboard with faster 74F257's (74F257's will also be available for those
who need them). We plan to purchase the chips from wither NCR or GTE.

If you are interested in a 65C02 for your Apple or compatiable, drop us a
line and let us know what kind of system you have (][,][Plus, //e or
Apple-compatiable [please specify brand]). You will be notified if/when
you may place your order. The tentative cost for a single chip is under
$10. Send your letter to:

     Hardcore COMPUTIST
     PO Box 110846C
     Tacoma, WA 98411

Hope this helps...

>Can a 65C02 microprocessor be used to replace the "standard" 6502 processor
>in an Apple][or][+? If so, are there any problems that may offset the
>benefits? Thanks in advance.

Rumor has it that soon all Apple //e's will be shipped with the new 65C02
microprocessor and the //c ROMs (much improved over the //e ones) as standard
equipment. Also, you will be able to obtain //c ROMs and 65C02 to install
in your present Apple //e. Apple has other things on it's mind right now,
so it may be a while yet (several months) before these things come to pass.

This mod applies to the //e only, by the way.

I read with great SORROW that The WOZ is leaving Apple. It seems that they
still don't see the great possibilities of the // line. Especially with the
advent of the new 65C816 or 65816 chip which will let the // line do BOTH
8/16 bit by doing double cycles for 16 bit mode(from what I've read).Mr. Scully
since his hiring has done really nothing for the // line. Don't tell me about the
//C. All that is, is a //e that's portable. Nothing else!! A company as big as
Apple has really to my knowledge done anything to help or educate the users
after the purchase has been made. Their tech line is ALWAYS busy and when you
do get thru they ARE helpful,BUT I always get the same person!!! Is he there
alone or what. WOZ'S statement that the // line is ignored is so TRUE. Since
Apple's inception it was a tight company. Now that MR. Scully has brought the
BIG COMPANY philosiphies Apple has grown up andis very reclusive!!! Try and
get some info from them. I can state this as I've been in APPLE land for some
4 years now and have seen this. I'm not saying that getting a Big Company
Image is bad, but JEEZ don't FORGET WHERE YOU CAME FROM!!! That is the ultimate
SIN..... Probably the happiest day for Apple owners will be when Mr. Scully
LEAVES!!! What they need is a PERSON who doesn't forget where APPLE came from
and supports there users with the same LOYALTY as WE have SUPPORTED them!!!
I KNOW that APPLE is on the ENET (although they don't let you know!) I don't
mean for this to be so negative but feel that it should be said. I also feel
that APPLE(Mr. Scully) Should get a little of his own MEDICINE!!!! I long for
the days when you could call Apple and get or talk to someone. Get the info you

need and say THANKYOU. Not like that STUPID 800 # that had everyone saying thanx. I would imagine to see see some replies so below will be my ENET addr. or if you really think I'm crazy and want to yell at me in person, my fone # will alos(oops) be there. Maybe even APPLE will answer although I doubt it! Wow maybe even Mr. Scully will call.

later!!!!

A phone information service has been set up by an L.A. company called Candle dealing with news, rumors, and product info about Apples (including Macs). It's aimed at moderate- to very-experienced users, and isn't usually tutorial. It's a free service while they test-market the idea, so the only cost is toll charges (no 800 number). The phone number in L.A. is 213-687-4662. If there's a big response they may put it up more permanently on a chargeable number.

Please, the first person to find out how to get the //e upgrade, POST
the information here. (By the way, the ROMs may not be exactly those used
in the //c, but should be similar in operation.)

Summary:

The bottom line for this and similar comments that appear regularly
here is the following: hackers are not a billion dollar market. Hackers
are not important to a billion dollar company except when they create
commercial software that helps sell hardware to non-hackers, i.e. ordinary
consumers. As far as I know, none of the principal players in the personal
business computer market, including Apple and IBM,
have anything to brag about in the way of end-user
support, particularly for technically demanding end-users.

You can't call GM in Detroit and expect to be put through to the
engineer who designed your Cadillac, much less your Chevy. If you want
that kind of support you deal with a very small custom car builder and
pay appropriately. GM will tell you to call the dealer, who will put the
salesman back on the line to tell you what a great little car you bought.
If you want a technical discussion you can probably talk to the service
mechanics for $40 an hour.

Steve Jobs has mentioned repeatedly that Apple is now in the
toaster appliance business. Believe it. I guess Woz finally did.

It just may be that improving the Apple][too much would adversely
affect Macintosh sales. IBM has these kinds of conflicts all the time.
The resolution is as much political as technical. Remember the last executive
Sculley hired was a Pepsi guy.

BPI is still a sound company and should be able to help.
KEEP TRYING!

As for a new general ledger package I would recommend
STATE OF THE ART General Ledger.
It is complete and easy to use, and several other modules
interface to it. ie A/R, A/P, Payroll, Inventory control etc.
See you local apple dealer for details and a demo.

<< pilot light on (very mild flame) >>

Just in case anybody out there is thinking of getting a C language package for the Apple][, I thought I'd throw in some info I acquired the hard way...

About a year ago, I decided I would like to get a C development package for my Apple //e system, and Manx's Aztec C65 looked good to me. I wanted a package that would run under ProDOS because I planned to do some heavy-duty development and ProDOS was better, newer, faster, etc.

When I called Manx, I discovered that the ProDOS version was not available 'yet', but would be in 'about a month'. The price would be $299, which I thought was quite fair, and their policy on development pleased me to death. Summarized, it is: "Develop all you want, and if you sell it, more power to you. We don't want a cut." The reason for that nice policy is that Aztec C will compile your C source into native 6502 code, which you can run without a "runtime" program, which would be copyrighted (apple pascal programs require "runtime pascal" which must be licensed).

WELL, the month went by, and I called again. "Another coupla months." This went on and on. I made the first call back in March 1984. By November things were "winding down" and the package would be out "by the end of the year". In December the latest scoop was "oh, end of December or beginning of January" . . . . . Y A W N !

TO THIS DAY the ProDOS-based C package is not available! Their girl knows me well by now, too! I'm the jerk who calls once a month and expects a package that has been advertised for a year to be available. (I got her good once with "Okay, what's your latest lie?" :-))

I have examined the DOS 3.3 version of the package, and it is excellent! I just don't want to develop under DOS, and I feel awful

because I know that if this package only existed it would be the best one available and well worth my $299. However, had I known it would be this long from the start, instead of being teased and put off for many months, I would have taken my money elsewhere, and I have now resolved not to do any business with Manx, ever (the DOS copy I played with was pirated! Want one? :-)).

I just thought I'd let everyone in netland know about that. I WOULD recommend the DOS 3.3 package, if I didn't hate Manx so much.

Any comments/questions/recommendations for other C packages would be appreciated.

Apparently Manx Software Systems has too few competent developers
to spread them any thinner. A couple of years ago one could call
Manx and talk directly with the developer of Aztec C (hi, Jim!).
He seemed to have been put on their Macintosh C project (first
release now available) and didn't have time to deal with ProDOS.
I have no idea whether there will ever be an Aztec C for ProDOS,
but if not it's a pity.

I am looking for a C compiler for an Apple][e.
I would preferably like it to be public domain.
If this is not possible, could anyone recommend
an inecpensive, but efficient one?

Thanks

Steve

> caveat: Not all 65c02's are created equal. If you want to

be Apple compatible, be sure to buy a chip made by the
same manufacturer (NEC, I believe but check it out) that
Apple uses. Different companies have added different
instructions to the 6502 basic instruction set!

Best bet may be to buy the chip from your Apple dealer.

   Having just acquired a Videx Videoterm 80 column card, I developed
this termcap entry for it. I purchased the Inverse alternate character
set with it, thus the so and se entries. Without the inverse set, delete
these capabilities. This has received about 3 weeks of non-intensive
testing, so if you have any problems, let me know.

```
av|appvv|Apple ][ with Videx Videoterm and inverse chip:\
         :am:bs:cd=16*^K:ce=^]:cl=16*^L:\
         :cm=\036%r%+ %+ :\
         :co#80:dT=8:ho=^Y:li#24:nd=^\:so=^O:se=^N:up=^_
```

I am posting this for a friend.

He has an Apple II e, or Apple II +. He wishes to connect a printer to it
but does not know the printer port address. Please can you help.

(The people who sold him the Apple aren't interested as he bought the
printer elsewhere.)

Thank you in advance for your help

Does anybody know of the existance of a library manager that runs on the
Apple][e?

Something along the lines of SQ and USQ would be fantastic but I would settle

for a simple library manager. I need something that doesn't require a CPM
softcard of sorts. Thanks.

It is best not to deal with companies that make promises like that
and fail to deliver. The last I heard, someone was trying to push
a law through that would prohibit advertising something unless it
was currently available. Any input on this?

I just bought a 512k Macintosh last night. Of course I love it already,
but I wonder if any of you out there in NetLand know of a board/connection
for an IEEE-488 (1978) bus. Also known as GP-IB or HP-IB. I would like
to connect it to Hewlett-Packard peripherals, such as a ThinkJet or
LaserJet.

Excuse my ignorance, but could there be some way to convert from an RS-432
high speed serial interface to HP-IB? Perhaps a human sacrifice or two?

Further, does anyone know of a driver (or some other path) to write to the
micro-floppies in Hewlett-Packard's Logical Interchange Format (LIF)? I
understand this may be a problem since Apple uses variable speed drives.
Any clues would be greatly appreciated.

I appreciate the response I received from all of you regarding C compilers
for the Macintosh. It was both informative and interesting. One further
request, if I may? Is there anyone among you who would be willing to send
me a copy of the Megamax compiler so that I may demo the package before I
cough up the $300? If so, please send the disk to the following address:

J. Froehlich
54 Trento St
Rochester, NY 14606

It will be worth a little something extra in you Xmas stocking. Please send your Xmas list with the disk! Thanks in advance!!!

I hope that Megamax is on this net, and that their lawyers nail you to the
wall. From what I have heard, the Megamax compiler is a very good one and
furthermore it is not copy-protected. If it is pirated all over the place,
though, they may decide that it is necessary to stop the pirates even at the
cost of screwing the legitimate users. I don't want to see that happen.

The responses are in:

US Mail :67

Posting:
  Raw source:6
  Raw Hex   :3
  Binihex (and other "codes") :6

My problems:

The initial program I wrote, I developed (tested) using one of our
UCSD unix systems. (That is a no no because it becomes property of
The University of California Regents.)

Well, seeing that It would belong to them and not to me, I dumped
that version and rewrote it (bigger and better.[More on that]).

So, I face a dillema. I want to US mail it, but there's a catch... I
have to start a little distribution house. So I will be doing
legal paperwork for a month or so. I'll probably require some $
for my costs and what not. I'll post the address and the details soon.

Specs:

Software interupt driven modem routines,
Reverse and forward scrolling
Insert / Delete line
Screen Dump
Inverse / Normal characters
Capture buffer
Capture buffer print and save to disk
Auto Dialing (for Hayes smartmodem and compatibles)
Redialing (User must initiate)
Dialing "phone book"

Possibles: (Depending on my class load and ambition)

Definable function keys (10 [open apple 0-9])
Transmit text file directly into vi.

Any other suggestions? (I'm not ambitious enough to put the kermit
protocol in, but I might be persuaded.)

Have any of you set up a home-business before? I'd like to hear from
you.

Egads...it is necessary to specify which interface is being used. i.e.
is he using a generic parallel card? a multifunction card? maybe a serial
card?

For the most part, you don't mess with the hardware ports unless you plan
to write a custom device driver, which in this case doesn't sound likely.
Stick to issuing PR#n where n is the slot number; this way is much simpler.

Assuming he hasn't got the tech manual, the port addresses are found at
hex address C0x0 through C0xF where x = 8 + slot number. For example,
a printer card in slot 1 (or phantomed there) uses C090 through C09F.

Good luck,

Can anyone tell me anything about a MICRO SCI A70 disk drive?
I believe that this is a 286K drive and thus is simply a double-
sided APPLE drive. Is that correct? How about compatibility with
APPLE PASCAL and APPLE CPM (PCPI flavor)?? Are they still made?
What is a used one worth? (still in the box, used once, etc., etc.)
Thanks in advance,

Paul <egapmh@ecsvax>

Thank you Mr. Muller for your helpful information, I have 10's of disks
with this exact problem; but since my power supply bit the bit bucket

I have no way to fix them. Could you possibly tell us netlanders how to fix a power supply? I know that you yourself have gone through several.
  It all started about 3 months ago when I flipped the switch on and nothing but garbage appeared on the screen. Eventually, the power supply would warm up enough to run my one disk drive for a few minutes; but after that few minutes the 12v output dropped too low to run the spindle and stepper motors simultaneously.
  Now it takes about 6 hours befor the computer has enough power to generate a fully synchronized video signal.
  Is there anything I can do about this other than shelling out the $45 for a power supply exchange?
  Any help would be greatly appreciated.

Jay McGinnis

Sorry... A few days ago I posted to the net that Excalibur went
 under. WRONG! I messed up in my info. They were only killing
 the apple part of SAVVY(and slowing down the IBM part).

A person sent me a message asking just what the status of a piece
 of software is when the owning compony goes under. Who owns the
 sources? Who about all the owners? What happens? I don't know

since Excalibur did not go under.

Send me mail . . . I L O V E mail

Just tried it. I think it was aimed at my three-year-old kid. A recorded
voice said something like "5-4-3-2-1-2-3-4-5-4-3-2-1-test out",
and then I got a dial tone.

> If there's a big response they may put it up more permanently on a chargeable

i recently purchased the CC02 'C' compiler from Folksoft and have been very happy with it. the only problem is the compiler handles only integer math.

it supports commands:

```
auto     break         case     char     continue
default       do       else     extern        for
if       int      register return        static
switch        while
```

reserved for future use:

```
double        entry         float         goto     long
short         sizeof        struct        typedef       union
unsigned
```

the compiler also supports all the <stdio.h> functions (as far as i can tell) except files can only be opened for read or write and not append (but you can write a function to set the file up for append).

the complier executed the BYTE prime number bench mark in 2min 30sec as compared to 47 min for the same program in applesoft.

the complier also allows 'in line' assembly commands. you can enter #asm......#endasm to enter assembly commands in the 'C' source code.

the compiler is available from:

Folksoft
P.O. box 441
Fayetteville, NY 130666
(315) 656 -7447 cost is $38.50

you also need an assembler to use the compiler. the complier is made to work with the TOOLKIT assembler or the CALL A.P.P.L.E BIG MAC assembler.

but it can be made to work with any assemblers (but you really need to
know what you are doing to make the modifications).

i have the BIG MAC.C assembler and have found it to work very well with the
compiler. i have assembled "object code" that was 23K with no problem (and
when doing this i didn't use features of the assembler for assembling very
large programs).

the BIG MAC assembler is available from:
CALL A.P.P.L.E.
290 S.W. 43rd ST.
RENTON,WA 98055
(206) 251-5222

cost is $40 for members. the membership cost is $51 for the first year and
$26 for each year thereafter. this includes a subscription to the club
magazine and some real bargins (i think) in software.
i think paying $91 (=$40 + $51) for just the assembler is well worth the price.
this assembler is better than some 6502 assemblers i have used on
main frame computers.

          BRAND NEW MICROCOMPUTER BOOKS FOR SALE.

         SELLING AT HALF OR LESS PUBLISHER'S PRICE!

               IBM , APPLE, UNIX, CP/M, etc.

(1) IBM PC, XT & OTHER CLONES.

1. IBM PC: AN INTRODUCTION TO THE OPERATING SYSTEM.
   BASIC PROGRAMMING & APPLICATION.
   (REVISED & ENLARGED)
   - by L.J. Goldstein & M. Goldstein.
   - $ 17.95, 392 pages, 1984.
   - sale price: $9.00

2. MS-DOS AND PS-DOS USER'S GUIDE.
   - by P. Norton.
   - $ 15.95, 266 pages, 1984.
   - sale price: $8.00

3. RUNNING MS-DOS
   - by V. Wolverton.
   - $ 19.95, 350 pages, 1984.
   - sale price: $10.00

4. MS-DOS USER'S GUIDE
   - by P. Hoffman & T. Nicoloff
   - $ 17.95, 312 pages, 1984.
   - sale price: $9.00

5. YOUR IBM PC: A GUIDE TO THE IBM PERSONAL COMPUTER
   - by L.J. Graham.
   - $ 17.95, 580 pages, 1983.
   - sale price: $9.00

6. PASCAL FOR THE IBM PC
   IBM DOS PASCAL & UCSD p-SYSTEM PASCAL
   - by K.W. Bower & S.J. Tomboulin
   - $17.95, 326 pages, 1983.
   - sale price: $9.00

(2) APPLE II, II PLUS, IIe, IIc COMPUTERS.

1. APPLE II USER'S GUIDE:
   FOR APPLE II Plus AND APPLE IIe.
   - by L. Poole, M. McNiff, S. Cook.
   - $17.95, 482 pages, 1983.
   - sale price: $9.00

2. UNDERSTANDING THE APPLE II
   - by J. Sather.
   - $22.95, ca. 200 pages, 1983.
   - sale price: $10.00

3. APPLE II GRAPHICS

FOR APPLE II AND APPLE IIe
- by K. Williams, B. Kernaghan, L. Kernaghan.
- $19.95, 188 pages, 1983.
- sale price: $10.00

4. BENEATH APPLE PRODOS
FOR USERS OF APPLE II PLUS, IIe, IIc COMPUTERS.
- by D. Worth & P. Lechner.
- $19.95, ca. 150 pages, 1984.
- sale price: $10.00

5. HOW TO PROGRAM THE APPLE II USING 6502 ASSEMBLY LANGUAGE
- by R. Hyde.
- $15.95, ca. 200 pages, 1982.
- sale price: $8.00

(3) MISC.

1. A USER GUIDE TO THE UNIX SYSTEM
- by R. Thomas & J Yates.
- $ 17.95, 508 pages, 1982.
- sale price: $6.00 (used)

2. CP/M USER GUIDE (THIRD EDITION)
- by T. Hogan.
- $17.95, 327 pages , 1984.
- sale price: $6.00

3. 6502 ASSEMBLY LANGUAGE PROGRAMMING
- by L.A. Leventhal.
- $ 18.95, ca. 600 pages, 1979.
- sale price: $5.00

4. FUNDAMENTAL OF DATA STRUCTURES
- by E. Horowitz & S. Sahni.
- $???, 564 pages, 1977.
- sale price: $8.00 (used)

YES

You said a while back that you had a source for an Apple //e
terminal interface program. What ever became of this? I, for one,
would surely like such a utility. How can I get hold of these sources?

Thanks

Does anyone out there have a listing of undocumented 6502 opcodes? From
talking to several people, I have discovered:

  - That these opcodes function differently depending upon the chip
    manufacturer.

  - That some issue of "Compute" magazine had a listing of these at some
    point in time.

Many thanks in advance; I'll sleep better with one more curiousity
satisfied :-).

> I would really appreciate any info about //e termcaps.

I post one every once in a while (last time was a couple of days ago).
Generally, you either use the raw Apple //e 80-column extended ROM,
which is not very satisfactory, or firmware built into some other
vendor's 80-column card, or a software terminal emulator program,
which often includes telecommunications and file transfer features.
Most such terminal emulators work with a termcap for a well-known

terminal type such as VT100.

There is a back issue of Byte which also mentioned the undocumented opcodes.

The wierdest opcode yet though is one a friend told me about. It may be
apochryphal so I think I will disclaim it right off. Supposedly, the
original 6502 had an undocumented test instruction (one of the x2H opcodes,
I think it was 12H) which would tie up the cpu and run internal checks on the
processor such as run through the address/data lines lightning fast, until it
was reset or a NMI occurred. Well, this testing had a nasty side effect....
The chips would get so hot doing this that after it was let run for a few
hours, the chip would either just fail, or every long once in a while

something catastrophic would happen and the chip would start smoking or actually catch on fire! It was thus descriptively named the HCF (Hold and Catch Fire) instruction. Supposedly, the Source or Compuserve had a 3 part article a few years ago describing this fascinating instruction. Perhaps there is someone on the net who worked on the design of the 6502 and could affirm or deny, once and for all whether the HCF instruction has ever existed or exists.

Software and Hardware advice needed for Apple //c

A close friend just received an Apple //c as a present and now has come to me for advice. After having boasted about the virtues of C, he is not content with Basic and desires a C compiler. In addition, he will probably need a printer (although I believe he had an Epson from his old Commodore-64 days).

Wanted Advice on the following:

C Compiler — Should be low cost, fairly complete, able to talk to the printer port. In addition, it should generate native code that can be run without the compiler or assembler. It should also run under the built in DOS and not require its own DOS.

Printer — Type of interface?, if he has the Epson, is that OK? What about the Apple printer(s)? Are there any major advantages to Apple printers over others?

Editor — Is the one that comes with the //c OK? Does one come with the Compiler(?) what is the best?

Like most of us, he is on a budget, so price *IS* a consideration.

As you can probably tell, I have no experience with Apple and would not like to suggest something inappropriate; that is why I posted here. I'm reasonably sure that there is at least one person in this group that already has a //c configured just this way.

Again, the net would prefer that you mail responses directly to me, I will summarize to the net shortly.

Thanx...

Help, I was playing Wizardry III, when my party of one good lord, and one good samurai, turned into one good lord, and one EVIL sam. both in one party! well, now having an evil character of level 7 I tried to go to level three from level one, and before when it just sent me to the castle, now permitted me to venture up. Much to my dismay, I met some men in arms, and women in robes, and promptly died!

I am now wanting to cheat a little, by restoring the status bit on my back up disk. However, since I don't have a boltac's mail order catalog for the third scenario, I will have to do it by hand.

Does anyone know the location, in track,sector, and bit number of all the attributes of a character? Even some of them would help. Thanks alot,
Lord Beirnes and Fig2 will thank you.

I am looking for some help on a problem a friend is experiencing. She has a IIe with an extended 80-column card and is encountering difficulties in running Ascii Express in half-duplex mode. Once she establishes communication with the host computer and interacts for about 30 seconds, her monitor "freezes" and the communications software hangs.

Any possible solutions would be much appreciated. Many thanks in advance.

The HCF instruction actually did exist in the early version of the Motorola
6800. This "instruction" was undocumented, as well, but I read an article
in an ancient BYTE (1978 or so) that documented the undocumented goodies
of 6800, and this was one of the instructions.

It doesn't strike me as too likely that HCF could have occurred on 2
processors, and given reputations of all the CPU makers around I would vote
Motorola as being most likely to screw up like this.

I haven't seen this addressed yet so here goes...
Does anyone in net land want to second guess apple
and prophesize when apple might get smart enough
to start selling the IIE and IIC with a 16 bit
CPU ??????

It seems to me that if they don't, the II family will
not be able to compete with upstarts like Atari's new
and much hyped 68000 line....

Any comments????

I just talked with MANX. They said they will be taking orders for version
1.06 which includes better runtime support libraries and support for ProDOS.
They will start taking orders in four weeks, and ship them in about six on a
first-order first-shipped basis.

They are also working on the version for Atari's and Commodore's answer to
the Macintosh (StXXX and Omega sorry, but I don't remember the names of
these Macalikes). After having the Mac version of C working, the port to the
macalikes takes less than three weeks, or so they claim. They also say that
these versions of ACCS will be ready by the time the mahines hit the market.

To all those who like posting things revelant to Macs only, you have
your own newsgroup, so please use that one.

I do not have a Mac, I have a IIe, and want to read about it, not the Mac.
If I wanted to read about the Mac, I would have joined the Mac newsgroup.

Thanks for your co-operation in keeping this an apple news group, and the
Mac news group for Mac postings.

Organization: System Development Corp. R+D, Santa Monica
Lines: 17
Summary:

Opcodes like HCF (halt and catch fire) go back far farther than the 6502.
I've seen this on lists of bogus op codes 15 years ago and were old then.
The majority of them date from the days of the first mass produced computers
(i.e. hundreds rather than a few hand-built copies) where assembler was the
only way and the machines were full of ideosyncrasies in efficient
operation--like the 1401 which had an opcode to read a card, punch a card
and print a line simultaneously, in part because the machine had no
interrupts.

I have just bought two new adventure games, Amazon and Farenheit 451,
by Trillium software. They are great games, four sides each, a mixture of
text and hi-res, and a big pharser (not as big as Infocoms, but big.)

I would like to back them up, although there is no writing to the disk,
I feel as though one side is going to go if I don't back them up.

Does anyone know the parms for them using Locksmith, Nibbles Away II,
E.D.D., or Copy II + ? If you do, please either leave me mail, or post

them for others to use also.

Thanks,
Andrew Rahme.

I have been trying to get some information on how to communicate directly
with my disk drives. I found one very good book called 'Beneath Apple Dos'
which tells most of the gory details. It gives all the right locations to
punch to do reads and writes, and even gives examples of code which will
perform the writes in the required 32 cycles/byte. However, when they get
to seeking to a given track, all they say is that turning the arm stepper
motor phases on in sequence from 1-4 moves it one way and 4-1 it moves it the
other. It then says that the timing of these phases is critical and they
recommend using rwts to do it. Period. NO indication of what is critical,
how long the phases must be on and off, and so forth. (If rwts can do it
consistently, it can't be that damned difficult!!).
I want to be able to run completely stand-alone, without DOS in the system
at all (this makes calling rwts rather difficult). Has anyone out there had
any experience with this (or just knows the magik numbers?).

thanks, all,

geoff sherwood

My apologies to the entire net community and in particular to the folks at
Megamax! In all honesty, I did not realize that this request was improper.
I am new to the net and obviously ignorant of its purpose. Ironically, the
very day following my initial posting I did in fact order the software in
question through a local dealer and am anxiously awaiting its arrival. I am
not making excuses or trying to cover up, merely acknowledging the fact that
my request was out of line and I can assure you nothing of this sort will
ever happen again!

I just received the update disk for prodos 1.1.1. It contains new
prodos system, new filer, and new basic.system (I think -- I cant take
a catalog of it right now, because I'm using my apple IIe in terminal
mode to type this right now!) But I didn't get any hardcopy
documentation with it. (Not needed to apply the update, just boot the
disk and it tells you what to do.) The salesman at my local computer
store (Which was giving copies of the update disk away free to anybody
who walked in off the street.) said that they had not gotten anything
describing it either. (Believe that and I have a bridge I would like
to have you look at...) In any case, he couldn't give me any idea of
what bugs were supposedly fixed, or why I should want it except that
it was 'better'. (You know the story!)

So my question to the net is --

Does anybody know anything about this release? Does it have any new
features? What bugs does it fix? What new bugs does it introduce?
Are there any 'gotchas' that I should know about before I try to use
it for production work?

Mail to me and I will collate responses, if any.

> I wouldn't put much stock in a HCF instruction, considering
> the VAST number of 6502 based machines.

Think about it. With the amount of "hacking" done on these, surely large numbers would have accidently executed HCF instructions and burst into flames. (hee hee hee).

I do support the theory that there may be an instruction, or types of instructions, that, when executed, causes a Degradation of the Instruction Set, killing off many instructions, and maiming others.

If you program in 6502 you know exactly what I mean.

A sample of Destructive Op Codes:

DHXI - Destroy Half of the X Index register
DHYI - Destroy Half of the Y Index register
AWID - Always Wander Into Decimal mode

There are more. Supposedly during chip testing of the first few million devices, the original manufacturer wrongly executed these instructions, limiting the power of the 6502 forever, or until the 65816 arrives. (Ahhhh, the price of compatibility).

I recently did some trading of software with someone I met through a bbs in michigan. All of the prodos disks he gave me were Prodos 1.1.1 This is a bit strange since there was no visible difference, and that he had it on all of his disks, not one had 1.0.1, or whatever the first version was. Upon talking to a local computer hack, we came to the conclusion that all

this guy did was change two bytes on the disk so that it said 1.1.1
I think this guy did this to say that he had the latest Prodos, and was
glory seeking of sorts. To those who get the 'new' Prodos, beware that
this has happened to me, and Unless it has an Apple sticker on it, it may
not be true.

Does anyone out there, have, in any language (high level), for any
computer, a program which will do simple two dimensional curves on a
Diablo printer. I type lots of lab reports and am tired of plotting
curves by hand. I have seen that Diablos can do simple graphics,
that's all I want. The ability to read in say four sets of X,Y data
points into the same graph would be nice. Any help in the area would
be most appreciated. BitGraphics and Character Graphics programs are
both quite acceptable.

Is the book *Beneath Apple DOS* still in print? I found a copy a couple
of years ago, but didn't buy it (alas). Now that I know it's an essential
part of any true hacker's professional library, I can't seem to find it.
Could someone tell me if it's still available, the ISBN number, and the
publisher's name and address? Thanks.

I am interested in interfacing a synthesizer (probably a DX7) to a computer (IIe, PC etc.). I am beginning to understand what I need to do hardware-wise, I am still confused as to what software is available currently, and of what it is capable.

How many tracks can I control? How many voices can be controlled simultaneously on an instrument such as the DX7, and to what degree of independence? How versatile are these programs musically? Is there a void here software-wise?

I appreciate any response,

Don

Would anyone out there know if there is software available
that can emulate "macwrite" and "macpaint" and other "Mac's"
stuff on an Apple //e?
If so, could you tell me where it is available commercially
and the prices if possible.

Thanks in advance,

The problem for Apple is its own products competing against each other.
From a consumer marketing point of view there is no point upgrading the Apple
][to compete effectively with the Macintosh which is a far more profitable
product.

Welcome to the world of consumer marketing...

David Hough

I've been playing Ultima III on my Apple II- off and on for about 8 months now. The characters in the group are around 20th level and all have the mark of fire and will soon have the mark of power.

Does anyone know where to find the Mark of the King? Supposedly, once a character has the mark of the king, his hit points can be raised beyond 550. It would be nice for my characters to have more than 550 hit points each.

Where is Exodus? I've heard that Exodus is actually a computer with slots which you put 'cards' into, but where are the cards and what are the consequences of putting the cards into Exodus?

I've found the temples in the underworld where characters can raise characteristic points (intelligence, strength, etc), but is there anything ele down there worth looking for?

What are some of the 'other' commands? I've discovered only one useful 'other' command thus far -- bribe -- which is useful getting around guards at a gate or stopping one from attacking you.

I've heard there is a treasure room in Lord British's castle. Is it worth going into? I haven't found it yet because I think it is protected by the power field next to the healer's room.

Is there some other, easier way to get rich quick than to invade the treasure room in Death Gulch?

Answers to these questions and other helpful information will be greatly appreciated. If you would just like to exchange information, drop me a line via e-mail and maybe we can trade notes!

Think

I have heard that the 512k Mac is not the real "FAT Mac" and that
the real one will be announced at the Apple annual meeting in January.
Now a rumor about that:

Apple is buying 20MByte 3.5 inch hard disks from Tandon for use in the
new version of the Macintosh.

About other things:

I haven't heard a good explanation for the continued shipment of single
sided floppy drive. Got any?

Why not a faster printer? Say, something between the Imagewriter and the
soon-to-be-announce laser printer.

The rumors that I have heard are as follows:

The January meeting will provide us with:
- a local area net
- a laser printer
- a color Mac
- hard disks for Mac
- the replacement of the Lisa series with a Mac based series

Now some things that I see as unavoidable in the future:
- a lap sized Mac with LCD display (is there a cmos 68000?)
- obvious extensions to the basic Mac that will result in something
  that looks similar to the workstation products from Sun, Apollo, etc.
  If they would just put the Mac in a package with some slots for
  plug-in boards like the Apple][they would please a lot of people.
- a Smalltalk or LISP machine (they will be forced into one of these
  because of things like TI's integrated circuit version of the MIT
  Lisp machine and because they want to be at the cutting edge)
- a much increased output from Apple's in house programming staff
  (they can't grow like they have been without developing more software)

The number one question is...

Will people still think that the Mac is special enough to buy when IBM
matches the windowing environment with software for the PC and PCAT?

I am using ASCII Express with the Apple IIc. I connected it to a Racal
Vadic VA212 modem. For some reason, all I get on the screen is garbage.
I tried modify the # of bits, parity, etc. but that doesn't seem to help.

First of all, does anyone have a similiar setup? How did you connect
the IIc port to the modem (i.e. pin to pin connections)? What settings
do you use to connect to a VAX?

I am in the Medical Sciences Teaching Labs at UNC and we have a TV production
department which writes scripts. Theses scripts are usually in two columns
across an 80 column page(text on the left, stage directions on right). The
TV people are *not* computer programmers but are above average computer users.
Applewriter I does not meet their needs and they are looking for another

wordprocessing package with 80 column capabilities. I have experience with
IBM mainframes and PC's but am in the dark about Apple software. It would
be preferable if the software were on NC State contract and/or available at
Student Stores(UNC,NCSU). Any help would be greatly appreciated. Please
respond by e-mail as I do not subscribe to net.micro.apple(but will
read it after this date).

The Apple][e has 80 column capabilities and we wish only to buy a new
wordprocessing package not additional operating systems or hardware. We have
Apple DOS 3.3 and a C-Itoh 8510A printer.

Not unless they don't bother to provide a version that includes a parallel
hardware expansion bus for devices like D/A, A/D converters, Digital
Oscilloscope boards, co-processors and the like. In fact, if they
delivered one with a 16 bit wide bus and CPU interrupt lines, they'd
have IBM's P.C. bus beat by a mile.

Does anyone out there have any experience connecting a non-Apple modem
to the Macintosh to use with MacTerminal? I've tried several different
DB-9 to DB-25 pin layouts and several different modems and can't seem
to figure out what's going on. I'd appreciate any assistance or
direction on who I can talk to about this.

Also, if someone could send my the source for macput and macget, I'd
appreciate it.

Thank you in advance,

Gary Lindgren

I'm posting this for a friend, I will pass on replys, but would prefer they
go to ..usceast!wood

He wants to know if anyone out there has any information on something called
a Cramapple for the Apple 2. It is supposed to upgrade the size of the Drams .

Any information on exactly what it is and does for you, price ,availability,
article references , etc would be welcomed.

Thanks
Ted Nolan ..usceast!ted

Let me try a few what ifs out.....

What if .. APPLE were to use the 16 bit version of the
6502 as a companion processor to the 68020 ?

What if .. They were to get ..hum.. maybe 1 meg in 64k
chips on the mother board. (substitute 256k chip if handy)

What if .. The Prodos and dos source were rewritten to allow
for 16 bit addresses?

What if the 68020 had the 'quick draw' roms available in this
single machine.

What would happen to all those MACs and IIe's out there if
this package were available for about 3000 $$US?

Now before you say I'm crazy or that this would be silly consider:

APPLE uses the integrated WOZ machine to control both the IIc and
the Mac. Whats so hard about swapping some romware electronically
to controll two types of drives. (or for that matter two drive types
under one system)

Many companies already have 68000's attached to II,II+,IIe models.
(Here I must admit that there are about 1000 of these out there max)

So what do all you APPLE people think ??

     Alas, Apple denies any plans to upgrade the IIe's to 16-bit
     era. Woz told mis_Infoworld that he was working on such a project
     then retracted that statement the next week. (Sounds like some
     heavy arm twisting to protect Mac sales).

     Rumor has it that Western Design (???) who designed the 16-bit 6502

was working on a plug in card for the IIe video slot. This sounds like a good deal. I would prefer a 68000 plug in card with (here I go again :-) 16 sockets to hold either 64k or 256k ram chips (jumper selectable -- someone tell me if this is impossible). The 68000 should run at 8 Mhz or higher.

Recently I posted a request for info about graphics routines for Aztec C. I got a lot of requests; it seems that a lot of people are interested, so I'm going ahead with my work on the hi-res graphics library for Aztec C. I'll mail it to those who specifically requested that I send it by mail, but due to the many requests I got I will be posting it to the net. I'm not sure when. It isn't finished yet, and my wife and I have a baby due (our first!) any day now, and I just bought a house, and so I'm not exactly breaking my neck to get this done. I'll try to have everything finished up sometime around the first of the year. Maybe sooner, probably later.

By the way, I really like the Aztec C compiler, but the support from Manx has been absolutely terrible. I have a hard time finding anyone there who seems familiar with the Apple version of their compiler. The response when I report a bug is usually something like, "Hmmmmm. I see." They have been promising a ProDos version of the compiler for nearly a year now. I think it got shelved while they got the Mac version working. At any rate, I'm not very impressed with them as a company. Their documentation stinks, too. As long as you work under the shell they supply you're fine, but I have been having a heck of a time implementing device drivers for use in a stand-alone environment. Some more support and better documentation would help a lot.

One problem with translating Lisa 7/7 into anything other than English:

Apple has already done it.

I believe so far the list is into:

German
French
Spanish
Dutch

And perhaps a few others.

     I have an ad for a hard disk (10mb) for the Apple][+ and][e
called "The Sider", from First Class Peripherals. According to the ad,
for $695.00 you get a disk and interface all ready to be plugged into
your Apple.
     This is easily the lowest price for 10mb on an Apple that I've
ever seen, and I'm thinking of buying one. My question is, does anyone
out there have any experience with this beast? I am particularly concerned
about reliability, and would be very grateful if anyone with information
on this product would contact me.
     If interest warrants, I will post a summary of my findings to
the net. Thanks in advance to all who respond.

Does anyone know of a (yes, I know this probably belongs in net.wanted)
LISP compiler/interpreter for the Apple][,][+, //e, //c?

I remember a distribution of a MicroLisp written in Basic (ouch!)
by the Apple Dealer's Software Subscription Group (Vol 3-5?), but
this version was too slow. Have any other compilers/interpreters
become available since?

Any information would be appreciated.

     Does anyone know of a way to get detect real time from Apple II
computers without buying a clock board? Is there any memory location
which steadily increments on some fixed cycle? I know that a time delay
of x seconds can readily be programmed in, but I am concerned about a
program with numerous levels of interrupts which still can refer back
to some subroutine which will return the real time. Has anyone done
something like this on the Apple II? If so, I would like to hear how
you did it.

                                    Thanks in advance,

In October of 1983, I purchased a Lisa computer from Mission Computer Center, Palo Alto, CA, whose operations were subsequently purchased by ComputerCraft. It was, at the time, represented to me that within a month there would be available both the LisaPascal programming language, and the LisaWorkshop programming environment, without which the Lisa is incapable of doing anything but the 7 applications initially offered. As a programmer of some 15 years, it should be obvious that I wouldn't buy a computer I couldn't personally program. In fact, I had every intention of making my living by becoming an independent software developer of applications for the Lisa. It was my intent to become self employed, and make my living by programming my Lisa.

On the anniversary of my Lisa purchase I tried for the umpteenth time to take delivery of a programming environment/language for my Lisa, and was again told it was unavailable. Also, the hardware "upgrade" which was supposed to have been available in June of 1984 was still not available. I beseeched the manager of the store with this story, and he suggested that I call the local Apple representative, which I did. I was told that within a week the hardware upgrade would be shipped to ComputerCraft.

At the end of November I returned to the store, and was again told that nothing was available. Returning in early December, I demanded a full refund upon return of my Lisa, and was told by the store manager that he couldn't authorize such, and that I would have to talk to the regional office. I proceeded to visit the regional office, and repeat my demand of a full refund.

I was told that the regional office was not authorized to authorize such a return, and that I would be contacted by a representative of ComputerCraft corporate, and left my work and home phone #'s toward that end. I was, as expected, not contacted. Having waited a full week for ComputerCraft corporate to respond to my request, I can only conclude that ComputerCraft not only never has supported me, but that they never will, and find no alternative but to initiate a lawsuit regarding ComputerCraft's breach of contract and fraud. In short, what was delivered to me was a closed system incapable of being programmed, and therefore something I would not have purchased in the first place if it had been so represented. I have every intent of pressing a law suit which requests not only a full refund of the purchase price, but also treble damages as a punitive measure to prevent ComputerCraft from continuing these unlawful practices.

Sunny Kirsten

Summary:

I called the company on their 800 number about 3 weeks ago. They said they had not started shipping yet but expected to in about 2 weeks (ie about a week ago. I have not called back since. Obviously this means no data on reliability. Has anyone actually got one of these yet?

I am looking for a version of kermit which will run on apple ///'s
Has anyone had any experience with such a beast, and if so where might I
find a working version. Or will the version for the apple][work on the
three in emulation mode ? As always if I receive enough replies I will
summarize for the net.

Thanks,

Ted Fidder

I'm having trouble using the KEYPRESS function in the unit APPLESTUFF.
The problem being that the function doesn't work. I have a IIe with an extended
80 column board and am working with Apple Pascal version 1.1. I
suspect that the problem lies with differences in I/O with the 80 col.
board. Does anyone know of a fix for this so that I can test for
keydown from a pascal program ? If so, please reply by mail or post
to the net. Thanks in advance.

[Sixteen men on a dead man's chest....]

Anyone have the address for Manx (makers of Aztec-C)?
I have access to their C compiler but need to contact them
before I make a copy. (No pirate I.)

BTW: Anyone who responds to this request is aiding and abeting
an obvious criminal:

>Subject: ASCII Express
>I am using ASCII Express with the Apple IIc. I connected it to a Racal
>Vadic VA212 modem. For some reason, all I get on the screen is garbage.
>I tried modify the # of bits, parity, etc. but that doesn't seem to help.
>First of all, does anyone have a similiar setup? How did you connect
>the IIc port to the modem (i.e. pin to pin connections)? What settings
>do you use to connect to a VAX?
>p.s. Anybody have a manual for ASCII Express

We go an Apple in from a local dealer. It had kermit in there.
So you might consult your local Apple store.

I know I will need to get a PAL colout card. The old Apple II had a
switch on the power supply for 110/220v and a couple of jumper pads to
convert to 50 Hz. What is the situation for the //e? Is there anyone
in Australian netland who has actually got one running?

Several people have asked for graphics routines for use with the Aztec C
compiler on the Apple 2. I promised to send these to someone a while
back but I seem to have lost their address.

Anyway, here they are. I haven't used this stuff in quite some time so
my recollection of it is a bit vague but I'm pretty sure everything works.
At least on an Apple 2e with Aztec C version 1.05B (probably not the current
version). These routines should have been put into separate files and built
into a library, I just never got around to it. The formatting of the code
probably looks a bit strange since the Aztec editor has tab stops every
four columns instead of every eight.

If you can't figure out what each routine does just check your Applesoft
manual, most of the names are the same.

My having created and posted these routines should in no way be construed
as an endorsement of Apple computers or as a statement that Apple computers
are suitable for any purpose whatsoever.

These routines are Copyleft 1984 by Me. Enjoy.

Richard Foulk

I am helping someone whose niece, age 6, is a victim of cerebral palsey
and who has shown interest in having a small computer.  For financial
reasons, we are looking at the popular 8-bit machines for which a broad
software base exists (Apple, C64, Atari).

Apparently, the child has severe fine motor impairment; she cannot write
and probably has little dexterity with her fingers.

Therefore, we are looking for microcomputer add-on keyboards made for
such folks.  Please keep in mind that the "keyboard" has to be
interfaced to the computer and we'd prefer not to have an R&D project as
the aunt, the niece, and I are on west coast, central US, and east
```

coast, respectively.

Please mail or post replies to net.

Thanks,

Brint

Does anyone know of a music writing program which runs on Apple
2's? We're particularly interested in a program which can
transpose.

Please mail comments to me. If there's enough interest, I will
post a summary to the net.

About a week before Thanksgiving I ordered one of these 10 MB hard disks from
First Class Peripherals, Inc. They sent me a letter about a week later with
a copy of their warranty (one page description) that thanked me for ordering
their product and informed me that my unit was due for shipment on Dec 3rd.
It arrived at my home on Dec 13th, I unpacked it the next day and have had it
up and running for 2+ days now. They are very careful in their packing and
their documentation. The Sider, as it's called, comes with an interface
board that goes only in slot 7, all of the necessary connecting cables, a
reference manual, and two double-sided floppy diskettes. One of the four
sides of the diskettes contains their installation software to format and
verify the disk. The other three sides have utility software for use in
installing ProDos, CP/M (either PCPI or Microsoft), and Apple Pascal (either
1.1 or 1.2). DOS 3.3 is supported as a matter of course. Their partitioning
scheme is a bit strange at first glance, but becomes understandable the more
you think about the problem of supporting four different operating systems.
I use Pascal almost exclusively, with a little DOS BASIC here and there, so
I have four small volumes (5.25 inch 35 track capacity equivalent) and three
large volumes (about 8 inch diskette capacity) for DOS, and the rest, with
minor allocations for ProDos and CP/M, allocated to four Pascal units of
3728 blocks each. Haven't really had a chance to shake the system out yet,
but I was favorably impressed by what I have seen so far. You don't get
a whole 10 MB for any one operating system, but I have the equivalent of
53+ Pascal diskettes online at one time and that's a whole lot more than
I have had before. For $695 I can only cross my fingers and hope that
someone doesn't buy them up before my warranty expires. More later if
there is interest.

[]

This is a summary of the information I received about the Sider hard disk for the Apple. My thanks to all who responded to my query. My personal decision is to wait a while before purchasing one of these units, both because $695.00, though a very attractive price, is a lot of money, and because the unit has not been around long enough for any information on its long-term reliability to be available, yet.

I, also, called the company, and was told that their disk, though compatable with both the Apple][+ and][e, is not compatable with the old Apple][. My machine is a][, though I have put Applesoft on the motherboard, making it essentially a][+. They told me that, if their disk would not work on my machine, I could return it within 15 days for a full refund.

My thanks, also, to T.J. Jardine, who posted a separate message about the Sider disk he/she recently acquired. I would also appreciate it if any/all owners of the Sider would post a note if they have any problems with their units in the future.

Again, my thanks to all.

Some time in September, Bill Parker posted the source to SAFECOM,
which is an encryption program for inter-micro communications.
I just now got around to looking into its innards and thought I
would let its potential users know that it is very easy to crack.

The encryption is done basically by adding corresponding letters
of a cyclic key and the plaintext, then splitting the resulting
byte into two 4-bit nybbles and offsetting them into the printable
ASCII range by adding a constant.

The first thing a cryptanalyst would do to crack a message in this
system would be to reconstruct the (key + plaintext) bytes from
the offset 4-bit nybbles; this is a purely mechanical procedure.

The next step would be a Kasiski analysis to determine the key
length. (This is described in the hardcover edition of Kahn's
"The Codebreakers"; it is simple to perform.)

Then he would stack the ciphertext into "bins", each enciphered
by one of the key letters. Since each of the stacks is just a
Caesar substitution, a correlation between each stack frequency
distribution and the normal alphabetic frequencies will show what
the key letter is for that stack.

Then, since the key is now known, the entire message can be quickly
decrypted using SAFECOM!

I estimate that it would take someone with appropriate computer
tools only a couple of minutes to crack a SAFECOM-encrypted message.
This assumes a moderately long message and a relatively short key;

if the ratio is not as favorable it would take somewhat longer.

i can't seem to find who it was that requested information
about Enhancement Technology Corp.'s PDQ II.
i was thinking of upgrading my apple IIe with this.
could you please include me on you list for interested parties.

or would anyone with the PDQ let me know how you like/dislike it.

thanx in advance.

It doesn't seem like such a coincidence, a Macintosh is an apple,
which is why the chief said apple...Macintosh, and is why apple
chose the name Macintosh.

Unless there is more to it than that, then it is pretty simple.

I am looking for printers for the Apple][+. I am mainly looking
for an Okidata, Epson, or a Gemini. Which is the best to use with
the Apple? Which is the cheapest and where I can find one
below list price (I am located in the Los Angeles area).

I do not subscribe to this group, so please reply via electronic
mail.

Sorry if I'm not from Apple, but it's really not as much a coincidence as it
sounds. You see, a macintosh (however it is really spelled) is just a type
of apple - whence came the name for Apple's Mac. Kinda neat, huh.

Hardly surprising, considering that McIntosh is the second most
popular variety of apple (the fruit) in the U.S.

Keywords: Kermit, Xenix, Lisa

I helped a friend install Kermit on a Lisa today, using the generic UX
Kermit posted a few months back. It worked, except that I had to
comment out a couple of lines concerned with sending a break signal.
There are two undefined symbols: TIOCSBRK and TIOCCBRK. These are not
defined for Xenix ioctl(2) calls. Is there a way to generate a break
signal under Xenix? Can it be faked? Please reply by e-mail. I will
summarize if there is sufficient interest.

Thanks in advance.

In the January '85 issue (#98) of Dr. Dobbs Journal the cover article
is a set of step by step instructions on how to increase the RAM in
a Macintosh to 512K for approx. $300. That price will probably
fluctuate considerably since it is based on the price of 16 256K RAM
chips, which can cost anywhere from "$15 to $45".

The instructions in the article are more than adequate; and include
all necessary photographs, diagrams, warnings, and trouble shooting
information. The article also lists some sources for the necessary chips.

Summary:

A while back I asked if and how Kermit under Xenix could send out a
break signal. As far as I can tell, and no one has contradicted this,
Xenix ioctl(2) calls don't include the capability of sending breaks.
The general suggestion was to fake a break by setting the line to the
lowest possible speed, send out some nulls or dels, and hope the
machine at the other end will treat the framing errors resulting as a
break.

Unfortunately, I have to report that this didn't work with the machine
I had on the other end, a HP3000. C'est la vie. I think its ugly to use
out-of-band signals to interrupt programs, don't you? (BTW, before
some HP wizard starts flaming me, I should mention that ctrl-Y works
for most programs, but not listf, the directory lister.)

Next question: do the HP wizards out there know if some control
character can be designated to interrupt all programs? The usual
e-mail and summarize offer, as always.

1/3/84

The most recent issue of PC WEEK (1984 Year in Review) describes a
new laser printer to be manufactured by Konica, the Japanese photography
company. The printer is Konica's own design and is said to be faster and
more durable then several of the small laser printers now on the market
that use the Cannon print engine. Prices, when announced, are expected
to be in the range of $3500 to $4000 for the low-end model with the
ability to add a more advanced adaptor for bit-mapped graphics. This
news is significant in that it affirms many peoples notion of the
direction printers and printing methods are heading towards. Having
used Konica cameras and Hexanon lenses for many years I am more than
eagerly awaiting the release of this new product. I am also sure that
as more units are released and prices drop more and more people will
begin using laser printers.

Lines: 34

I'm not implying that there is only ONE bug in MacPascal, or anything, but this one is a killer (to me, at any rate)

I am running Pascal on a 512K Mac and trying to develop a fairly large program, with a view to making a stand-alone application of it when the appropriate tools become available and I can afford them. One reviewer of MacPascal led me to believe that a 512K Mac would allow 10000 line programs to run under Pascal.

This appears not to be true. I don't have an exact count of the lines, but the source file for my program is just under 24K, and it is probably no larger than 1500 lines. This is what started happening: I added one or two lines and tried to test things, and got an error message to the effect that I was passing too few parameters to a procedure or function. The little hand pointed to the program header ("Program blotblotblot"). Delete the lines I had added, and then things ran fine. I fiddled around a while, and finally deleted a bunch of code that was no longer needed, and THEN I could add the one or two lines I was trying to add in the first place! All the tests I could bring to bear pointed to a hypothesis that there is an internal invisible limit on code size in MacPascal, which is far lower than the size of memory would lead one to believe. My listing takes 16% of the available memory, and the crash happens before many data structures get initialized, so it is not that I have an inordinate amount of data. BTW, I do have both Quickdraw libraries and the SANE library included-I think these together take about 6% of the available memory.

Is there anyone else who has experienced this? The documentation very carefully omits any reference to a place to call for help or to report bugs, and there is no promise of bug fixes or updates, and no registration that I could see. So, does anyone know to whom I may report this problem? Would Apple be able to help?

I have a two-year old apple //e with a Novation Apple-Cat 300 baud
modem. The following problem has existed ever since I purchased the
system:

If the system is booted up cold and I dial out, a connection
will always be established upon the first try. However, when
booting up and attempting to dial out *after* using the apple
for more than a few minutes, a connection with the host will
NOT be established, regardless of who or what is being dialed.
The time necessary to elapse before I can successfully dial out
and establish a connection again seems to equal the time the apple
was left on prior to dialing.

I sent the modem back to Novation earlier this year, and it was
returned "fixed" according to them. However, the problem still
remains; the necessary elapse time was just reduced a little.

Does anybody have any insight as to what this problem is caused
by (heat?) and what the cure might be?
Thanks in advance,

Dina Street

I have a 300 baud Novation Apple Cat modem. Since I find myself
using it much more than originally anticipated, I'd like to upgrade
it to 1200 baud. Can this be done without buying a new modem?

All comments and suggestions appreciated.

I am looking for printers for the Apple][+. I am mainly looking
for an Okidata, Epson, or a Gemini. Which is the best to use with
the Apple? Which is the cheapest and where I can find one
below list price (I am located in the Los Angeles area).

I do not subscribe to this group, so please reply via electronic
mail.

  I have had a ProModem for about a year, and have noticed that some of the things that are mentioned in the manual are not true. For instance, if the line is busy the manual says that the modem should detect the busy signal, hang up and try again. This does not happen. Also if you have the options processor installed you have the ability to create logon macros, which I have not been able to get to work as of yet. Another problem with the options processor, is with its ability to send and receive messages at preset times, this does not work either. When attempting to receive , it will answer the phone , detect carrier and then hang up. Other than these problems, I have been satisfied with the operation of the modem. If anyone has had the same problems, and knows of a solution please send me mail. Also if you have any other problems, send mail. If there are many responses I will summarize to the net.

Thank you,
Dave Szczepanski

Does anyone out there know of a routine that will produce a dump of the
graphics screen to a printer from within an Apple Pascal program ? I
would appreciate anything from a note on a commercially available
package to the algorithms for an ass'y language routine. Thanking you
in advance -

   Okay....assorted rumors about the Mac II to be announced later this
month at Apple's meeting (or so I hear).

1) Of course, color is the big expectation.
2) 1 Meg of memory is the other big expectation.
3) Actually, double sided drives are another hope.
   I get conflicting news about one or two internal, though.
4) Production of the Appleline interfaces (finally). Not everybody
   is hoping, though.
5) High-speed hard disk interface port...no more serial crud.
6) 12 inch monitor.

Anybody hear anything else??

                            -Dave

Yeah!   Novation sells an upgrade card which converts your 300 baud
apple cat modem to a 300/1200 baud modem. That's what I use.

Summary:

A while back I stated that Xenix had no ioctl(2) call to assert a
break signal on the line. It turns out that I was wrong. My only excuse
is that pages were missing from the tty(M) entry. See below:

From Cliff Neighbors:
The Santa Cruz Operation, Inc.

in system III one uses the ioctl TCSBRK command to send a break;
(refer to section TTY(M) of the XENIX Operating System Reference
Commands (M) section); the lisa zscc serial driver supports this command.

I have and Apple IIc and have been trying to find enough information on
it to write my own psuedo-VT100 terminal emulator. I have enough information
on ProDOS, the keyboard and screen routines, what I can't find is info
on the serial interfaces that are built it. My current terminal program
(Ascii Express Pro V2) works pretty well, and it seems to think that the
card is a super-serial card. Does anyone have any info on this card?

What I need are word and bit assignments for the 16 byte locations per slot
north of $C090, as well as any interesting addresses for built in routines.
For example, how to send an interrupt (break) signal? Mail to me or

post back to this news group. Mike

My brother says that if you have Applesoft in ROM, the Zoom Graphics program
can recover the picture. Zoom Graphics is available from most stores and
mail order services. Since it depends on Applesoft routines, you need Applesoft
in ROM at the same time the picture is stored in RAM.

I need to know how much memory (& disk space) one full page of text & graphics will occupy in the Mac (& on a disk, hard or floppy) using MacPaint.

SRN

thanx

I was wondering, since the Mac can run programs written in Pascal (UCSD), can a person run P-code written on an Apple II + on the Mac? What does the Mac actually use in terms of Pascal and P-code from the P-machine?

I have the misfortune of attempting to get my Apple Imagewriter to print
graphics. The situation is as follows:

I have a picture on the Apple screen constructed through a crude
  Pascal drawing program.
My problem is that I want a hard copy printout of the picture.
How can this be accomplished? Is it possible to do a "screen dump" of
the graphics screen? If so, how? If it is not possible, how can I get
my printer to print the picture?

Thanks
-Steve

A friend of mine would like to know if there are interfaces

for data acquisition equipment to Apple IIe machines. He
runs a chemistry lab with pH testers, spectrometers, etc.
and would like to be able to sample and store data under the
control of his Apple IIe. If someone knows of any such
interfaces (hardware/software), I'd like to know who the
manufacturer is, and the type of interface used.

Please send mail responses, since I do not normally read this
newsgroup. I will summarize to the net if necessary. Thanks.

I am helping to design upgrades for the macintosh. The lowest
level upgrade is for 1M byte. That hopefully will cost only
about $1000 or less. The 1 meg board will go inside of the mac,
and the mac will look no different from the outside. However,
it will have 1 meg of memory plus the memory that the mac already
had (1.5 meg total if you had a 512K mac) that runs twice as
fast as the regular mac ram because it is DMA. We have designed
boards going up to 8 meg. We have implemented our design up
to the 4 meg level. Here is what we are planning to do: You
can buy the 1 meg upgrade, and it will be internal with a connector
that is invisible from the outside of the mac (like the interrupt

and reset switches) on the bottom right vents. If you connect
the card-cage that we are designing to the connector, you can
add several additional things... more memory, a color board we
have designed, a speedup board, and some others... The card
cage has a case like the mac's, and it fits snugly under the
mac, adding 5 inches to the mac's height, and no inches to it's
footprint.

The question: Is this what you guys in netland really want?
Do you have any questions or suggestions?
Please let me know, because we are really doing this to make
the macintosh a REALLY serious machine. Since our product will
be compatible with the hyper drive, and any other hard drives,
the mac can become sort of like a mini-computer. Imagine 8 Meg
of ram and a 192 meg hard drive...

I heard this from some guy in the local computer store.
He seemed reliable and clamed to have on on order already.

He said Apple will be coming out with a Turbo-Mac this Summer.
It will contain up to 2MB ram, 68020 processor, color and
an internal 960k double sided sony drive. He said the special
price (for developers or dealers or something) will be $1800
dollars.

He also said Apple will anounce that in is stopping to manufactue
the Lisa computers Completely.

-Gadi

P.S. This is only a rumer, but he seemed like he knew what he was
talking about....

Pie Writer < Hayden Software

I certainly don't have time to write a software review, but Pie Writer
is a very functional text editor and formatter. Pie Writer's roots go
back to QED (forerunner to vi (?)).   For an Apple][WP program, it
has an abundance of commands for manipulating text.

The text formatting commands have to be imbedded in the document.
They take the form of nroff dot commands, and most of them are identical
or very similar to corresponding nroff commands.

Very robust, fast, nice user interface. Especially friendly to vi and
nroff users. $150.

Those sound like very worthwhile upgrades. What I would really like to see
more than anything else is virtual memory, though. You could put a memory
management chip on the memory expansion boards, or replace the 68000 with a
line to a board containing a 68000 with memory management. Probably the
former would be preferable. This would enable the Mac to run 4.2bsd,
although the porting effort would be significant. If it could be done under
$2000, you would have a guaranteed market here at C-MU, since all students
will soon be required to obtain a cheap 4.2bsd workstation (which one is
under discussion) to hook up to the VICE network in early 1986.

Millisecond Timing

I have written a short piece of Assembler code which adds millisecond- precision timing to the Macintosh's list of desirable features. The code is very simple (it sets up the VIA to generate millisecond interrupts -- a short interrupt handler increments a long-word memory location after each interrupt). It is designed to be used with assembler, pascal, MSBasic, (Mac Basic?), and perhaps MacPascal (for interpreted languages on the Mac, the code is short enough to poke into memory; a CALL statement will pass the interrupt handler a pointer to the variable you want to use as the timer location -- then just read the variable whenever you need to see how many milliseconds have elapsed). If you are interested, mail me a request, and I will send you the code.

Serial Technology

I currently work in the Reed College "MacLab." Reed College has a particularly aggressive 5 Year Master plan for aquiring and implementing computing resources, which involves loaning every student on campus a Macintosh. We are a small group, located in the physics department, who are dedicated to Macintosh development and problem solving for the Reed Community. The MacLab has developed several software packages (now being sold by an outside vendor) --

GriffinTerminal -- a Tektronix 4012 emulator for the Mac, with
quickdraw support, file transfer, mouse button
interrogation,
etc. etc...

GriffinText -- a fast, 32K ASCII text editor for the Mac

AELM-51 -- An Intel MCS-51 mnemonic assembler/editor/downloader/
terminal for the Mac.

We are particularly obsessed with controlling external devices (primarily networks of 8051 microcontroller single-board computers which we have designed) and methods of collecting and displaying real-world data with the Macintosh. A real-time-oriented compiled Pascal for the Macintosh is our pet project at the moment, along with a Finder-like (icon-oriented) interface to our external hardware networks.

If you have similar interests, or if you would like to know more about what we are doing, we're always glad to talk, via USENET or telephone or US mail.

Some while ago, someone posted a binhex version of xlisps version 1.2 for the
Macintosh. I know lisp, but don't know Xlisp.
I found out by examining the source that you can do something with
classes etc, but how.

Can anybody provide me with some documentation on xlisps, may be in
particular, about xlisp 1.2 for the Macintosh ??

Thanks,

[...]

I recently bought a UCSD Pascal p-system with my Macintosh and am
looking for a few things to feed it.

1. p-system programs, either for Mac or other systems (they're
   supposedly portable). Public domain sources preferable but
   not essential.
   (Also, libraries.)

2. information on transfering from one p-system to another, and, if
   possible, from a non-p-system to a p-system (and
   vice-versa).

3. Macintosh routines to access the Mac toolbox & Quickdraw
   routines. (The few subroutines included are not really sufficient.)

4. Information about p-system user's groups, newsletter, etc.

Mail is okay (I'll summarize to the net if it looks like people are
interested). Post to the net if you want, though.

Thanks very much for any help or directions.

 I echo the vote for PIE. It supports dot matrix printers exceptionally well.
If you have CPM, WORDSTAR is excellent also but it doesn't support
all the bells and whistles on dot matrix printers as easily.

[given to the line eater]

This is being posted to help out a local school in the Memphis area.
The story goes like this:

     The school was told that a version of LOGO was available for
their 64K Apple IIe so they ordered it. They were then told that it
was no longer (or not - whatever the case may be) available, but that
a 128K version was the only thing now available. They really don't
want to go through the conversion expense (for the Apple) so the question
is this - does anybody have a copy 64K version for sale or know where
one can be found?

NOTE: As this article was being posted, the person making the request
     to me found a place that will sell a 64K version for ~$130. Any
     bids from net land?

Please mail all responses to:

I: Does *ANYBODY* have a termcap for the IIe with the Apple 80 column board? Please reply via this newsgroup.

II: (FLAME) I have been using my IIe to communicate with our local system at 1200 baud for a year now, and have had real frustrations with the slowness of the Apple Monitor. I need to pad linefeeds with three nulls to keep the monitor from dropping one to three characters at the beginning of lines. I have been using the Apple SuperSerial card, and could find no way around the problem. This is not a particularly big problem if one communicates with only one or two systems, but became a real hassle when dealing with a number of different ones: VAX/Unix, VAX/vms, Cyber, Lockheed Dialog, etc.
I have been phoning the Apple hotline about this every few months, trying to get a) a straight answer,and b) a solution to my problem. The first few calls resulted in answers of "I don't know," "It must be your software," (stupid answer) "maybe it's the modem," (another stupid answer) etc etc. Finally, a few months ago, one of the guys admitted that it was the monitor program on the 80 col. card (a straight answer), but his (non)solution was to hang around the local computer store and wait for an upgrade that might appear some year. arghhhhhh.
First, the types that populate most computer stores are hostile to any question except "Can I buy a Lisa if I pay full price?"
And second, most of them have the technical smarts of a planarian worm.

What is most irritating about this is an attitude on the part of the customer service people that if there is no currently available fix to the problem, that the problem isn't a problem, it is an undocumented feature.

I like Apple, and I think they are good for the industry; but let's not confuse them with a *real* computer vendor, that gets on bugs, has a real field service organization, etc. Oh, by the way, if anybody does have a fix for the monitor problem, I would appreciate hearing about it.

Curious name for a word processor, and maybe intentionally so. "Pie" or
"pi" is an old printer's term for scrambled type...

In reply to Screen dump in graphics mode brl-tgr!scooper

I have an Apple //e with a C.ITOH prowriter. It is the same
thing as apple's old DMP. I use a TYMAC parallel interface. It
type of software that you are using, but the TYMAC card lets you
print whatever is in the hires screen from BASIC. I know that
the old Apple DMP came with screen dump software that was a

machine languge program. If your drawing program is in basic,
using their screen dump in conjunction with the ampersand
vector from basic. If it is not in basic. I suggest trying to
break out of the program and saving the screen onto the disk and then
running the DMP software or initiate the ^IGD2 command (TYMAC) which
prints the second hires screen in double size(? double means bigger
than normal not double screen size). For more information,
mail me a letter with some more specifics in it about what type of
software and things that I might need to know to help you better.

P.S. I would also like to know about anyone with an Apple //e
termcap that uses the 80-col card.

<nibble> . . . <nibble> . . . <nibble> . . . <BYTE!>

One of the last commercials in Superbowl XIX was Apple Computer's
annual weird Superbowl ad. The initial reaction of everyone who
wasn't expecting it was, "What the hell is *this* an ad for???"

It starts with a line of men and women, all wearing three piece suits,
trudging through dusty scrub to a depressingly played "Heigh ho,
heigh ho, it's off to work we go". They're marching blindfolded,
each with his or her right hand on the preceding fellow's right
shoulder, up along a trail . . . and over a cliff, one by one.

The last one in line stops as the guy in front of him suddenly isn't
there. He feels around in front of him, alarmed, as a voice-over
says:

     On January twenty-third, Apple will introduce the
     Macintosh Office. You can look into it . . .
(The survivor lifts up a corner of his blindfold, looks down where
his predecessors went--)
     . . . or you can continue with business as usual.
(--and looks behind him, to see *another* line of businessmen,
walking blindfolded, in a line up the trail. . . .)

  8+ Meg main memory has me drooling. Do you have a better interface for
the hard disk? Already existing hard disks for the Mac have been reported
to be fairly slow. If you could get a good/reasonable timesharing BSD 4.2
workstation out of the Mac, you have a customer. I assume that your 5 inch
high box has plugs in the back so you can plug in a reasonable number of
devices (ala APPLE][, IBM XT, etc)?

The "slowness of the Apple Monitor" is not the problem. It's the Apple
hardware.

Scrolling the screen on an Apple involves moving 23x80 characters in memory.
This requires about 3700 memory references. There isn't time to do this
in the 8.3 milliseconds that you have between characters arriving on a
1200 baud line, even if you don't bother with such things as branching
and incrementing.

> What is most irritating about this is an attitude on the part of
> the customer service people that if there is no currently available
> fix to the problem, that the problem isn't a problem, it is an
> undocumented feature.

It's more like a documented non-feature. The Apple monitor does not
actively support interrupts, which are the only solution to the problem.
On the other hand, the hooks are available so that user programs can do
their own interrupt processing. One of the reasons most terminal programs
do not do this is that most communications cards do not adhere to the
Apple standards for interrupt handling, which were established rather
late in the game. See the Apple //e Reference Manual.

Although it is true that the firmware in the Apple Super Serial Card
loses characters at baud rates over 300 (a fact that is mentioned in
the documentation), good terminal software can easily remedy the
problem. I have used the SSC with an IIe at 9600 baud (with no
padding) using the program Softerm II by Softronics of Memphis
Tenn. The software is so good that it can even run your printer
concurrently and still not lose a character.

....
For the past year I have been in the habit of automatically dumping
certain newsgroups to read at home. (This involves a rather
complicated procedure that dumps the news at 4 in the morning,
reformats it for nroff (with headers and bullet lists) and then
prints it out along with a table of contents and a permuted index).
However, neither I nor the printer room staff appreciate dumping
40 or 50 pages of compressed (or worse yet, uncompressed) mac hex
code every night. Someone has created net.sources.mac. PLEASE
USE IT! That way those of us who want mac code, but don't have
the time to peruse the net.micro.mac and net.micro.apple, can get
it at our leisure, and everyone should be a little happier.

                                    Many Thanks,
                                        Kee Hinckley

Does someone have a driver/simple communications program combination
under Aztec C for the Apple II?
I would like to be able to do file transfers between our UNIX SYSIII system
and the Apple Aztec C environment.
I guess I would need this on a Apple (yech!) DOS 3.3 formatted floppy because
I can't download.

Thanks in advance .....

In article 287@boulder.UUCP Vincent Heuring writes:

> I: Does *ANYBODY* have a termcap for the IIe with the Apple 80 column
> board? Please reply via this newsgroup.

Yes! I have a terminal package that emulates the fuctions of a
vt-52. It will be released on net.sources as soon as the TERMCAP
description is prepared. It is able to use *ANY* modem
configuration that the P-system is capable of.   The emulator is
written in 6502 assembly and is about 900 bytes long. Hardware
requirements?

Apple //e or //c
80 column card in AUX slot.
Any modem that Pascal can use.

The problem is NOT in the Super Serial Card. The problem lies in the
80 column support routines in the //e and //c. THEY ARE EXTREMELY
SLUGGISH. Keep looking in net.sources, my program will be there
soon.

I would appreciate any information regarding a C compiler for the Macintosh. I am
interested in doing some development work in the area of educational software. I
m currently using the HIPPO-C Level 1 package. Has anyone out there had any
eperience with this package. If someone has experience with a C package they can
recommend for software development, I would appreciate hearing from you.

[...]

I have just finished talking to the guys at Megamax and was notified of a new release of the package. This new release has a few things all of you have been yelling about. 1: It now has the mini-finder from the compiler and the linker, no more typing in those file names. 2:It now supports the creation of drivers and desk-accesories. 3: The linker has been improved. (It is now a little faster). There are also a few misc. bells and whistles to be added.
In the next release they hope to include a smaller editor (Hooray! 50K+ was just slightly too big). Also the enum types and the other stuff from that proposed revision.
Not to wave my flag again, but these guys have put out a rather good package. It out benchmarked all of the competing packages, it comes with a librarian, it is rather well documented, supports floating point, register variables, bit wise stuff. It produces reasonably compact, double clickable code also. To top it off, its NOT copy protected (My hard disk loves it) and it is marketed at a fair price, $299 (Quantity discounts, etc.)

> Serial Card with a 1200 boud modem. Several people have said that
> it loses characters, but I find this a little hard to believe.

The Super Serial card is not at fault. It can handle a heck of a lot
more faster baud rates than 1200. The problem is the Apple's
screen hardware and supporting routines.

The //e, more so than the //c has problems in the 80 column mode.
The display is memory mapped in an interlaced fashion. Half of the
screen is stored on the card in the AUX slot and half is stored on
the regualar text page. (That's why when you hit reset, you get
every other character on the 80 column screen.) Ok, to access the
other AUX page of display memory, you must store to two memory
locations. One tells the card to sense for the second location. The
second location toggles the region of memory you want to use. (both
are mapped into the SAME $400-$7FF range.)

Ok, that doesn't sound two bad, but that means to scroll, you must
access 2 switches, 1100 memory references, another switch, 1100 more
references, and some more to clean up the last line. THAT'S AN AWFUL
LOT OF TIME TO DO THAT. 1200 baud just can't keep up.

On top of that, Apple didn't optimize the routines on the //e. I
haven't verified, but the //c's screens appear to scroll much
faster.

I reccomend a better solution made by Computer Stop of Hawthorne,
CA. They make an 80 column card (about $99 on sale) that does all
the display updating in HARDWARE, so when I want it to scroll, I
need ONLY 4 MEMORY REFERENCES. Truly an improvement.

'nuff said.

I am using SUMacC to write a communications package and I am
having trouble using the RAM serial drivers. I have been
sucessful in using the ROM drivers but I want to have the
Xon/Xoff that Inside Mac says is only available with the
RAM drivers. RAMSDOpen always returns an error even though
Inside Mac gives the resource ID for the driver and says that
it is stored in system file.

Could anyone give me any advice on this? Even the method for
using the RAM serial drivers from another compiler would be usefull.

     Thanks,

Summary: Requesting method for posting 6502 source code

I have just finished writing a terminal program for the Apple //e
and //c computers with the 80 Col card in the AUX slot.

Functions:

1200 baud support
Scroll reverse
Insert line
Delete line
Full cursor positioning
Clear to end of line
Clear to end of frame
Inverse video.

Hardware needed:

Apple //e or //c with a modem the is compatible with the PASCAL
system. (The program itself is written in 6502, however.)

The program totally by-passes the *SLOW* routines by Apple, granted,
my program isn't lightening fast, but it gets the job done.

FIRSTLY:

Does anyone want this?

SECONDLY: How should I post it?
       (Raw source, hex, etc. Any suggestions?)
       Should it become a mail in?

Please have your mail dated before February 15, 1985 the decision will
be made on February 20, 1985.

What is the magic that the Open-Apple and Closed-Apple keys perform? My Apple][+ obviously lacks them; I sat down with a //e and wrote a Basic hack with a GET statement to see what they do, and I've learned that they do NOT do either of the following:

1. Generate any character that a GET statement can see. [My hack sat and waited forever...]

2. Modify the apparent ASCII values of normal keys. [PRINT ASC(A$) produces the same result with Open-Apple and A together as with A alone.]

So what DO they do? Any help will be appreciated.

Cheers,
Dick Binder   ("Beware the Jabberwock, my son!")

You may have wondered how to use PRINT from the FILE menu
(at least I did). This feature, as far as I know, only
works for MacWrite 2.20 and MacPaint 2.2:

It is possible to print one or more documents of a kind
one after another without starting up MacPaint/Write,
reading in the document, choosing PRINT, PRINT, open the
next document, choose Print etc.
You can PRINT a document right from the desktop!

The steps are as following:
- select one or more documents (using shift-clicking or
  dragging a rectangle)
- choose PRINT from the FILE menu

Now MacWrite or Paint is started up just for printing
the selected documents. After the printing has been completed
you are back on your desktop.

This feature IS described in the Macintosh User`s manual,
but before we had our upgrades this was "not implemented".

It is possible to move inactive windows, i.e. windows
behind an active window, without that inactive window
becoming the active window (are you still there?).

To do this hold the "command" key down while moving
the inactive window with the mouse in the drag-bar.
That window won't pop to the front now.

One small correction, as of 11/1, the price of Unside Macintosh is now
$100 (ONE HUNDRED), down from $150. IDI says the turnaround time is about a
week.

Yes, the software does exist, its called MacTerminal, and you can easily
transfer stuff to and from a unixc Machine with the Macput and MacGet programs
written by Dave Johnson At Brown U.

Macterminal is available almost everywhere by now, and I can send you
Macput/MacGet if you would like them...

A couple of suggestions...

1) Make sure the TABS are set correctly, a STTY TABS should do the trick

2) Makre surew the wrap modes, newline etc are turned OFF.

3) Make sure your macintosh is really set to VT100 mode, this can get
   ""undone"" if you change settings and dont save the Terminal document
    before using the document.

4) Make sure you have a "valid" termcap entry for vt100's, not one of the
   numerous broken ones...

    I use Macterminal in the vt100 (and vt52) modes on our Unix Vaxen
    (running BSD 4.2) all the time and have had no problems. It also
    works fine under (suprise!) Eunice...

                David.

[bug food]

    []

    Does anyone have a termcap entry for an Apple][e running
    the extended memory, 80-col card? Please mail directly to
    me (I imagine this is the nth time someone has requested this.)

    Also, someone complained in private mail that the above card
    is too slow for effective 1200 baud use. Does anyone else
    have any experience with this card at 1200 baud? I
    briefly glanced at the Rom listing for the card and it does
    look slow for page scrolling.

--
    Mike Eve   Boeing Aerospace, Seattle

...uw-beaver!ssc-vax!ssc-bee!eve

I assume you are talking about the 'dumb terminal' program that comes in the firmware for the super serial card from Apple. I have successfully used this combination (Apple SSC and extended 80 column card) as a terminal at 1200 baud to a VAX running system V. I had to specify 'stty nl1 cr3' to get it to work. (In case you are running BSD, that translates to the maximum possible delay for both carriage returns and new-lines.) It is painful to watch the lines zip out and then scroll soooo slooowly, but it does work. However, I have a complaint about this 'program'. When you run it in 80 column mode, the cursor seems to be stuck in column 2. This problem doesn't happen in 40 column mode. I called Apple tech support, and they told me that this is a known problem, and an updated ROM should be available sometime in the spring. They did not promise that it would fix the slow scroll problem though. All in all, I recommend against trying to rely on this firmware for using the Apple IIe as a terminal. Buy a commercial terminal emulator instead, (or do what I am planning on doing, write your own) Most of the commercially available programs can handle 1200 baud and 80 columns just fine.

Along those lines, The guy I talked to in Apple tech support suggested that I bug my dealer for a thing called the 'Apple II Programs Disc' which the dealer could get a (presumably free) copy of by writing to Apple Tech support. He said that it had been described in a newsletter for dealers called 'Apple View'. He said this disc has a dumb terminal emulator program that fixes the column 2 cursor problem. He said it did not scroll fast enough for 1200 baud operation, but I expect that suitable delays from the host would make it usable. He also said that this disc contains a lot of useful and/or fun programs that the dealer could use as demos. Unfortunately, I asked both of my local dealers, and neither of them had even heard of either the Apple II programs disc, or the Apple View newsletter. One of the people at one dealer remarked 'We get so much @#$ from Apple, that nobody has the time to read it. We just throw away most of it.' I asked them both to look into getting the disc, but I don't hold out much hope. If you have better luck, let me know.

To answer your original question, I dont think the terminal emulator in the firmware has enough smarts to make it useful with vi or anything else that requires cursor motion sequences. I specificly asked about this when I talked to the tech support person, and he said that the firmware dumb terminal did not support cursor motion sequences, even in 40 column mode.

I would like to get some comparative data on the various brands of
hard disks for the Macintosh.

I am specifically interested in:(1. the average head seek time; (2. the
average data transfer rate; (3. how well random file I/O works; (4. how
the disk responds when it is nearly full; (5. general problems or comments
concerning hard disks and micros. Thanks in advance. Please reply by mail.

The review of MacIntosh Pascal by Dennis Brothers in the recent A+ magazine prompted me to go ahead and get Pascal. What follows here are my own impressions (and gripes), a mini-review.

Disclaimer: The following is written on my lunch hour, off the top of my head, and without access to the manuals or Brother's review. Therefore, any errors of fact should be attributed to me. The following represents my own opinion solely.

MacIntosh Pascal, the long-awaited MacPascal, is finally available off the dealer's shelf. It is an interpreted version of Pascal with a large number of very useful extensions. It appears (from the documentation) to conform quite well with the ANSI standard, and also conforms closely with Lisa Pascal. Some of the extensions are: REAL string types, Lazy I/O (which overcomes the read-locking problem when input is expected from the keyboard), quite extensive built-in support of the MacIntosh ROM, and so on.

Note: REAL string types--by that I mean one does not need to be concerned with the length of a string a priori (other than providing a maximum length), and the true length is available via a function call. Also, several string and substring manipulation functions are included.

GOOD THINGS:

Debugging: The built-in debugging environment is *very classy*. Breakpoints can be set by using the mouse to place stop sign icons next to the lines in the program listing window at which stops are desired. An Observe window lets you type in the name of any variable (or any expression, really), and have those expressions updated at every breakpoint. By choosing go-go from the run menu, the breakpoints become tracepoints (or watchpoints, depending on your terminology) and the observe window is updated at every breakpoint, but execution continues without intervention. You can step thru the program,

and the observe window is updated every step. Finally, if you choose step-step, the stepping and updating occurs without user intervention. A hand icon points to the line being executed and moves through the program as execution proceeds. The program may be stopped at any point by choosing halt from the menu.

There is also an "Instant" window which allows any valid pascal statement to be typed in and executed *any time*. This is also a good debugging aid.

Toolbox support: There is extensive built-in support for Quickdraw procedures and functions (My impression is that every Quickdraw procedure is there, but there are some caveats given about the use of some of them). The SANE environment is fully supported. There are a smattering of built-in procedures supporting event manager and window manager routines and the sound driver is well supported.

Beyond that, there are a procedure and three functions which allow ANY of the ROM calls to be executed. The user supplies the trap number and the arguments, and that's all! All you need to know are the trap numbers, and how to use the calls without blowing up the system.

One sample program supplied is a text editor, which shows by example how to substitute your own menu bar for the Pascal one (and get the Pascal one back when you're through!), how to manipulate windows, how to handle a TE edit record, and how to handle mouse events. It is quite good in some respects.

Error reporting: This is reasonably good. The error messages are clear, and a "thumbs down" icon points to the offending line. The down side is you only get to see one error at a time, so correcting a program for the first time could be tedious.

Editing: The program listing has its own window, and all the normal Mac editing features are available for editing the listing. In addition to double-clicking to get a word, you can triple-click to get a whole line, which is sometimes handy.

BAD THINGS:

Speed: In a word, SLOOOOWWWWWW. Brothers in his review rates it about as fast as MS BASIC. I think it comes in a bit slower, because Pascal apparently pre-scans the code EVERY time you start your program to catch what would be considered compile-time errors in a compiler environment. This can be irritating in an extensive debugging session.

Memory: Here we hit the low, I think. The manuals very carefully avoid mention of how much memory you actually have to work with. The "About Pascal" display tells you in percentages how much you have used, but there is nowhere that I have seen that gives a hard figure here. There is apparently no way to increase memory by sacrificing stack or system space, as there is with MS BASIC. And the amount of memory seems smaller than the 29+K you could eke out of MS BASIC. Maybe the stink some people raised about the shortage of memory in MS BASIC caused the people at Think to avoid allowing easy access to

hard numbers . . .

As an example, the text editor example mentioned above is marginal for the memory in a 128K machine. With the listing window up, the program takes 90% of the memory. The largest file you can edit with it is (apparently) 5K. My attempts to make small additions to the program (three or four lines, at most) cause Pascal to run out of memory.

The worst of it is, when you do run out, the recovery is to exit back to the Finder! Saving your edits does not help, because sometimes the act of saving is what triggers the out of memory error!

When the listing window is closed, the same program take 50% of the available memory. Probably this is what allows it to run in the first place. If the data area is about 8K (including 5K for the text area), and that represents 40% of the available memory, then the available memory is about 20K. Not too great. And this probably represents a generous upper limit.

If you really want to go the whole nine yards and do a full Mac environment application, you will need a 512K machine, no question.

COPY PROTECTION: Think Technologies deserves some real hoots in this area. The package is copy protected up to ying-yang. It is not even one of those schemes in which the program can be copied and run as long as a master disk is inserted once per bootup--you have to use the master disk as supplied. (Maybe Microsoft is not such a villain in this area, after all!). Several copy schemes are employed--at least three that I know of, and maybe four. A couple are easy-the copy-protect bit is set, and some necessary files are hidden. Beyond that, there is most likely a bad sector scheme, and maybe Apple also has a copy protect bit for a whole disk, as well.

Dennis Brothers told me that it is the most thoroughly protected piece of software he has ever seen, but that he has cracked it. (He won a bet from Think for doing it, too!) But he can't let the rest of us in on the secret, unfortunately.

If you are one of those constitutionally unable to contemplate buying protected software, this one is not for you. On the other hand, if you like the challenge of cracking protection schemes, you might enjoy the puzzle this one affords.

Brief Aside: I am not a lawyer, but my understanding is that there are specific provisions in the copyright law which allow purchasers of software to make backup copies of the software to protect their investment. Thus, vendors who protect software in the manner described above are, in effect, denying their customers a right specifically given by law. Unfortunately, the reality of the situation is that there is little point in suing the vendor over this denial of rights. But I sure would like to see a bit more attention paid to the laws governing these issues, ON THE PART OF THE SOFTWARE VENDORS, as well as on the part of the purchaser.

OVERALL: Overall I rate the product about 8 on a scale of 10. One way or

the other I can live with the copy protection. The memory problem will be solved when I get my memory upgrade. The speed problem should be addressed eventually when Think brings out the package which upgrades this Pascal to a full development system. This is PROMISED for first quarter next year, so at least sometime next year it should become available. The good features outweigh all the bad by a fairly decent margin. And the language sure beats MS BASIC!!

I'm trying to develop a C compiler to run on a VAX to generate code for
Apple. Does anyone have any comments on
1) using so-called portable C compiler for this purpose
2) modifying small C to emit code for 6502 and beefing up small C to be bigger
3) any other method of getting one, including buying it
4) anything else germane to such an endeavor
?

The problem is not the speed of the Apple II thats causing the
problems, but the contacts in the Pad. When the pressure on the
Koala Pad is to small, the Pad returns zero values. The problem
also exists when the Apple is using a speedup card like the
Accelertator or SpeeDemon.

I have an Apple Disk][(for the Apple][/][+/][e) that I would like to adapt
to run as the external drive on the new Apple][c. I would expect the drive to
be compatible except for the cable. Does someone know if this is true? The
drive port on the back of the][c uses a 19-pin D-connector. Is there a

company making adapters to connect the old 20-pin ribbon cables to the 19-pin port? Or perhaps replacement cables for the old drives? (A lot of the wires on the cable carry power, so I expect they dropped one of the power lines on the][c.) If not, does anyone know of a source of 19-pin D-connectors and covers? (Preferably solder-type.) What documentation do I need to look in for the pin outs on the][c drive port? Thanks for the assistance!

well after two error-free years, my apple][+ disk drive is beginning to die a rapid death... but its a strange problem, I wondered if anyone out there had similar experiences/helpful hints.

The outer tracks work perfectly, the inner tracks are flakey with the flakiest tracks on the very inside.

Disks written long ago are only slightly flakey.
Newly formatted disks work perfectly (no bad blocks)
Both old and new disks get extremely flakey when things are written and subsequently read from the inner tracks.

Yes, it sounds somewhat like head positioning and possibly alignment problems, has anyone had similar problems or know how to fix it.
(I do have access to scopes, etc.)

I too am interested in the whereabouts of the MacWrite containing the
new features described in MacWorld. I just received a Fat Mac and
the version of its MacWrite is 2.2. This version certainly doesn't
have page numbers in the scroll bars or the other new features.

```
#
# Apple //e with 80-column card
# The modem interface is permitted to discard LF (maybe DC1), otherwise
# passing characters to the 80-column firmware via COUT (PR#3 assumed).
# Auto-wrap does not work right due to newline scrolling delay, which also
# requires that you set "stty cr2".
# Note: Cursor addressing is only available via the Pascal V1.1 entry,
# not via the BASIC PR#3 hook.  All this nonsense can be avoided only by
# using a terminal emulation program instead of the built-in firmware.

Yes, interrupts are locked out for too long and characters can be lost
during scrolling. This is a bug in the firmware and can only be
avoided by using your own 80-column code that is more careful about
the duration of "critical regions".

I've heard a rumor that it's possible to speed up the Mac's

computaion time by somehow turning off the display (which eats up
something like 80% of the CPU time...)

All inquiries from local gurus have indicated that while it is
possible to do this on the Lisa, it is not possible on the Mac..
Still, the rumor came from a fairly reliable source. Maybe it's
buried away in the Inside Mac documents... Can anyone help me?
I really want a Mac, but it's too slow for what I need to do
(real time control of a digital music synthesizer which will require
a fair amount of floating point calculation)

hello   hello,

Does anyone know of a terminal emulator for the //e that will do either a
vt52 or vt100. I will be tying into a VAX. Also does anyone know if Apple
in all there infinte wisdom has some type of newsletter?? If not I think it
would behoove them to do so. I've also seen alot of things mentioned about
Apple Tech Support. What's the fone # and why doesn't Apple let people know
about it. It seems that Apple doesn't care to much about there users out there
"educated or not". Why people should have to join "Apple Core" or some of the
otheres is beyond me. I invite others to reply and let me know of your thoughts

on this. One last thing::: Does anybody have a the GAME port working with 2 joysticks???? If so please let me know.

Thanx

In addition if anyone can give a better explanation of the LA50 in graphics mode than is supplied by the ABOMINABLE manuals DEC provides with this printer I would certainly appreciate it! DEC seems to think you will connect it to your PRO and use "screen-print" all the time, and so you don't need to know how it works. The LA-50, by the way, is a very nice printer for the money and can often be cheaper than its Japanese cousin (considering that it has a serial interface).

Has anyone tried a substitute printer for the Imagewriter?

I would like to either use some parallel Epsons we
already have (sitting on some PCs), or buy a quiet HP
thinkjet.

Are their any technical books on Macs for programmers besides
"Inside Macintosh"? Dalton's abounds with books on the
grizzly innards of VICs, C64s, Sinclairs,... but all
the Mac books are for "the rest of us".

Does anyone out there know how to interface a VIC-1525 printer to the
Macintosh? This is a dot matrix printer from commodore and it uses a
non-standard serial type interface. It connects to a 6522 and has
these signals:
     pin 1 serial srq in
     pin 2 ground
     pin 3 serial atn in (host signals)
     pin 4 serial clk out/
     pin 5 serial data out/
     pin 6 reset/

Since I already have this printer and $500 is a bit steep for an
imagewriter, I will be eternally grateful if anyone can help. I assume
that I may need a software driver once I get this figured out. To my
knowledge the only commercial interface is FROM the CBM host TO an
imagewriter.

     Apparently, there are still news programs out there that will
not handle a news group that needs > 14 characters significance, such as
net.micro.apple.mac. Since the control message to create this group didn't
make it very far anyway (is there some connection here?), it would be
possible to kill net.micro.apple.mac and create net.micro.mac instead.
I would rather not do this, but a significant fraction of news sites would
not handle the longer name (at least it's better than 6 character names,
case indistinct :-) What is the consensus?

Yes, I think that you should post the upgrade details for the Mac.
Also, if there are enough people in netland that want to do the
upgrade themselves, we might want to consider purchasing the 256K chips
together to get quantity pricing.
   Does anyone have the current price breakdown for 256K DRAMS
(mine are quite out of date), and a list of potential sources?

Ahhh Yup, it sounds like you need the old heads aligned. The very same thing happened to my Apple][+ and its drives. You should really have the drives looked at ASAP, my experience was that I had a great deal of difficulty reading the disks I have written with the 'flakey' drives after they were fixed...

'Hope that helps....

Hello,

Ascii Express ("The Professional") works pretty well as a vt52 or z19..

As for the Apple Technical support #, the one I use is in Westboro Mass, and they're number is:

(617) 481 8101

I have always found them to be very helpful, they even called me back at
2am once (I had called them around 1:45am, someone must have been hacking
reall(!) late.)

David.

Well, I also had trouble with my Disk][drive, at the age of 2. My
only solution was physically pushing the drive head back to beyond
track 0...unfortunately this is only works for the next couple of
boots. A much better solution is buying a new one, such as a
Micro-Sci A2, or Quentin. Both are excellent. Also, I remember a
msg. on the net about high density floppies...could someone tell me
when these will be available, and who is producing them?

For Sale: One Used   Epson MX-100 Model III printer and One used
Pkaso printer interface board (for an Apple II + or e and the
Epson). The Pkaso interface is compatable with the Orange Micro
Grappler interface (does screen dumps etc.).
The printer has just had a *new* print head installed.

(I have bought a Macintosh and no longer have any use for the
Epson printer).

Price: Can $950.00 for both printer and interface card.

The reason graphics will not work with a LA50 and a Apple is do to the fact
that the LA50 logic bd was desined with the SAME escape sequences as the
LQP series!! It was and is only for DECPC's. Although it is other wise the
same as the CITOH, and the Apple Image Write. You can as you probaly know
that it will print but graphics are not supported by he Software people! You
can go in to these programs and change the ESC sequences or you can probably
try and buy the logic bds for the Image or CITOHPro Writer. Although I have
never seen the CITOH hires print I can assure you that the IMAGE writer is a
phenomenal printer in hires!
. Also for the person that replyed to my VT52
emulator question, I did try ASCII EXP"The Pro" with no difference. When ever
I try to use the "PHONE" the esc seq. come on the screen but dont work. I'm
probably doing something wrong so if you can explain a little further (ie.
setup etc) I'd appreciate it.

Thank You!!!

JoeCraparotta (NY1MM::Craparotta)

David Spector - I tried sending you mail but it bombed at the ihnp4
location. I'm wanting the sources and manual pages for Macput and
Macget. Can you please send them to me? I will be eternally
grateful (well, maybe not ETERNALLY...). Thanks,

Tom Buckley

Summary (!) of the FLOOD of responses to my question about the open- and
closed-apple keys on a //e , so I could try //e software on a][+:

1. They are the same as Pushbuttons 0 and 1 on the game port.

2. Some software may not run anyway - this I haven't tried. If anyone
    has tried to run Applewriter //e on a][+, any info will be appreciated.

3. Open apple + CTRL + RESET will do a warm boot with ProDOS.

Thanks for all the help!

Cheers,
Dick Binder   ("Beware the Jabberwock, my son!")

<Macbugkiller Macline>

I'm about to try transferring some software from our 4.2 unix system to
the Mac, and I was wondering if anyone out there knows about the pin
assignments for the mac serial ports. I would like to hook it up to
a unix tty line, and I can tell at a glance that the sockets are smaller
than the rs232 sockets on our terminals and lines. I'm not a hardware
person, but I think if I knew the pin system I could work it out.
Please, mail only.

              Thanks muchly
              Ted Nolan ..usceast!ted

Where can I get a copy of the manuals for Macintosh Pascal? My sister, who
works for Apple, was able to get a pre-release copy but without any
documentation. Thanks.

Don't dream it; BE IT!

You have the numbers backwards: the Mac display hardware steals
approximately 25% of the RAM cycles from the 68K, reducing its "effective"
clock from 8MHz to about 6MHz. Apple makes a point of the fact that the
cycle-stealing does NOT affect ROM access, so the toolkit code runs full-out
at 8MHz.

But no, I don't know of any way to turn off the display.

>   How can you take the binaries from the DOS verion of the

>   Aztec C compiler and run them under a 'custom' Operating System?

I assume you mean the linked applications, not the Aztec compiler itself.
In which case, you have to replace much of the C library with routines to
use the "custom" OS instead of DOS 3.3. Then, if the "custom" OS use of
memory does not conflict with Aztec run-time usage, all you need do is
load and execute the linker output binary file.

Hi there, Yes, I do read net.micro.apple! Sorry you couldn't get to me..
There were a few people who sent mail to me via UUCPnet and to whom
I couldn't reply because I couldn't get mail to'em, but heres the Macput/MacGet
sources with the manual pages...

...Sorry they're not in Archive form..., I'll see about putting in archive form
and then re-posting them to net.sources...

-Enjoy
Dave.

This file contains the Following:

Manual page for MACGET
Manual page for MACPUT
Corrected MacGet program (in C)
Corrected MacPut program (in C)

All of the above were skillfully crafted by Dave Johnson at Brown, and
have been maintained (at New York University) by David Spector.

```
.TH MACGET local "31 July 1984"
.UC 4
.SH NAME
macget \- receive file from macintosh via Xmodem/macterminal
.SH SYNOPSIS
.B macget
[
.B \-rdu
] [file]
.SH DESCRIPTION
.I Macget
receives a file from a Macintosh running MacTerminal.
The File Transfer settings should specify the "xModem"
transfer method and a "MacTerminal" remote system.
This program is designed for use with the 0.5 Beta and newer
versions of MacTerminal, but includes a compatibility option for the
older -0.15X Almost-Alpha version.
.PP
To use this program, log into the unix system using MacTerminal,
start macget with the desired options, select "Send File..." from
the "File" menu, and open the file you wish to send.
If MacTerminal is properly configured, it will put up an indicator
showing how much of the file has been transfered.
Several Control-X's may be used to force macget
to give up if the transfer fails.
.PP
```

```
The optional
.I file
parameter specifies the name to use when creating the unix files,
otherwise the Mac file name is used
(with spaces converted to underscores).
.PP
If none of the
.B \-rdu
flags are specified,
.I macget
receives three files from the Mac:
.IB file .info ,
.IB file .data ,
and
.IB file .rsrc .
This mode is useful for storing Mac files so they can
be restored later using
.IR macput .
.PP
The
.B \-r
flag specifies
.I resource
mode.
Only
.IB file .rsrc
will be created, from the Mac file's resource fork.
.PP
The
.B \-d
flag specifies
.I data
mode.
Only
.IB file .data
will be created, containing the data fork of the Mac file.
.PP
The
.B \-u
flag requests
.I unix
mode, in which carriage returns are converted into
unix newline characters, and the unix file
.IB file .text
is created.
A file saved from Mac applications as "text only" can be transfered
using this option to convert it to a normal unix text file.
.PP
The
.B \-o
flag specifies "old" (version -0.15X) MacTerminal compatibility mode.
You must manually disable XON/XOFF flow control in this version to
perform file transfer; this is done automatically in the newer versions.
```

```
.SH SEE ALSO
macput(local)
.SH BUGS
Doesn't work over flow controlled communication lines,
or when using rlogin.

.SH DESCRIPTION
.I Macput
sends a file to a Macintosh running MacTerminal.
The File Transfer settings should specify the "Xmodem"
transfer method and a "MacTerminal" remote system.
This program is designed for use with the 0.5 Beta and newer
versions of MacTerminal, but includes a compatibility option for the
older -0.15X Almost-Alpha version.
.PP
To use this program, log into the unix system using MacTerminal,
and run macput specifying the desired options and one file to be sent.
If MacTerminal is properly configured, it will recognize that a file
is arriving on the serial line and put up an indicator showing how
much of the file has been sent.
Several Control-X's may be used to force macput
to give up if the transfer fails.
.PP
If none of the
.B \-rdu
flags are specified,
```

.I macput
sends three files to the mac:
.IB file .info ,
.IB file .data ,
and
.IB file .rsrc .
This is useful for returning files to the mac which were stored
using macget.
.PP
The
.B \-r
flag specifies
.I resource
mode.
Either
.IB file .rsrc
or
.I file
will be sent to the Mac, along with a forged
.B .info
file and an empty
.B .data
file.
The file sent becomes the resource fork of the Mac file.
.PP
The
.B \-d
flag specifies
.I data
mode.
Either
.IB file .data
,
.IB file .text
or
.I file
will be sent to the Mac, along with a forged
.B .info
file and an empty
.B .rsrc
file.
The file sent becomes the data fork of the Mac file.
.PP
The
.B \-u
flag requests
.I unix
mode, which is the same as
.I data
mode except unix newline characters are converted
into carriage returns.
Human-readable unix text files sent to the Mac using this option
will be compatible with applications which expect "text only" files.

```
.PP
The
.B \-o
flag specifies "old" (version -0.15X) MacTerminal compatibility mode.
You must manually disable XON/XOFF flow control in this version to
perform file transfer; this is done automatically in the newer versions.
.PP
The remaining options serve to override the default
file type, author, and file name to be used on the Mac.
The default type and author for
.I resource
mode are "APPL" and "CCOM".
.I data
mode defaults are "TEXT", "????", and
.I unix
mode defaults are "TEXT" and "MACA".
.SH SEE ALSO
macget(local)
.SH BUGS
Doesn't work over flow controlled communication lines,
or when using rlogin.
.PP
Doesn't set the bundle bit on resource files,
to incorporate any icons into the Desk Top.
Use setfile to set the bundle bit.
.SH FEATURES
Properly initializes the Creation Date.

There is an augmentation of BASIC written for the Apple][by
Stan Smith, Paul Tenczar, and Allen Avner called EnBASIC.
There is a graphics package written for the Apple][called TGS.
(The Graphics System.) This is put out by Accent Software.

Are there any ports of either of these two items to the IBM PC?
Is there anything close to either of these for the PC? What
I actually want is something that runs on a Zenith 150, which
is almost an IBM PC. Thanks very much.

Does anyone have macput and macget for vms???
If so, Could you mail it to me or post it?

Thanks in advance

Does anyone know about the Color Mac. I heard that they were coming out
with one. If so please let me know as I'd rather hold off buying one till
then.

thanx

The issue that Apple "bought" is the special post-election issue, not
the regular week's issue. It is due out today (thursday the 8th) or

tomorrow.

If you mean, with a "dumb" serial interface using the built-in 80-column
firmware, forget it. I posted such a termcap entry here not long ago,
but due to the lack of a "real" CR function it is not very useful.

[When in doubt-Click the mouse]

I was in a local Apple dealer when a saleman friend of mine showed me a brochure for a new program called Mac-Smith. This program promised it could copy any disk--no matter what type of copy protection is used. They specificly say that it will copy MacPascal with no trouble. Suggested retail price is $59.95 but they are selling to retailers for $39.95.

Has anyone seen this program work? I'm assuming that this kind of program is legal but it must really tick off other vendors who try to copy-protect their software.

Any comments would be appreciated.

Well, my sources indicate (although I HAVE NOT VERIFIED IT)
that ProDOS goes & looks in Monitor ROM for the word
"APPLE][". If it does not find it, it fails to boot.
This rumor comes from a guy who works at a store that sells
apple]["clones", so I think it's pretty reliable.
Given this fact, the patch is pretty obvious; just check the ref.
manual for the address & find the reference to it in ProDOS.
I agree it it seems strange of Apple to protect their
software this way. It was my understanding that most of the
bad old clone makers had been run out of business. In that case,
would it not be reasonable of apple to try & make ProDos as
generally acceptable as possible? Even to those people who
had purchased those distasteful copies. Or was it just that they
couldn't resist the chance to punish the people that had bought
rip-off machines. [I don't begrudge people for buying the cheapest
product, but I think it is/was a pity that the clone-makers were
able to do as well as they did with such obviously unethical copies. I
think the legal system did not show itself very well on this one.]
BTW, I had heard earlier that ProDOS looked at the disk controller.
Maybe it checks both for authenticity.

Subject: LISA problems
Newsgroups: net.micro.apple

Is there anyone else out there that is using a 2/10 LISA with the 7/7 operating system? If you are are you having any problems with it? I am currently using the forementioned machine to write some documents and beleive that I have found a bug in the operating system. When we do some editing on large (300 pages) documents, the machine will crash after 4 or 5 edits. Sometimes it gives an error number which our tech-rep says means a memory error. She replaced our memory for us, but it does not help. I beleive that the problem is the the cut and paste buffer starts to overwrite the operating system in high memory and the machine can't continue.

If you are having this problem, please let me know.

Marc Behr :-(

Technically, it is impossible to change either of these characteristics
without violating the semantics of K&R C. So the authors have a (not
trivial) excuse for doing it this way. It would probably have been nice
if they'd provided an option to avoid this; some C compilers for micros
supply such an option.

The new draft ANSI C standard contains some careful wording to the effect
that compilers are entitled to do such optimization if the results are
certain to be identical to the unoptimized version. This was arguably
true of the K&R definition too, but now it's explicit.

Release notes for SumacC were posted on USENET a month or so ago. (Please don't ask me for a copy because I only have it in hard copy.) According to the notes, SumacC is still in beta release and is available only over the ARPA net. The notes specifically say that the folks at Stanford are not equipped to duplicate tapes and disks. Sorry about that...

I would like information on the Corit package for Mac. This is the "advanced" text editing package, with more features than TextEdit. There are several references to it in Inside Mac, indicating that it is not part of the ROM but rather takes up part of the application's memory space.

So where does CoreEdit live? Where is it documented? Any info or pointers appreciated.

I recently posted a query asking for the bit pattern of the
wrist watch cursor to use in a MAC program. The responses
were helpful, so here is what I learned.

Several people pointed out that there is a wrist watch character
in the Cairo font. This was a good suggestion, as it had not
occurred to me to look there.

Several others said that this cursor is available as a system resource,
although they did not know the resource ID. This is exactly what
I needed...the ID # is 4.
I used GetCursor(4) and obtained what I wanted.
(There are cursors defined for 1, 2, and 3 as well.)

Thanks to all who responded!

Except for some really gross dependencies on misfeatures of the old 6502,
existing code should work just fine using the 65C02. I did this switch
on my Apple //e a long time ago and have had no problems with it.

However, unless you are going to use the new instructions there is very
little reason to switch. If you DO use the new instructions then your
code will not port to any machine except the Apple //c.

[Aren't you hungry....?]

I need to apologize. A few weeks ago I shot my mouth off and said that the 512K Mac could be had for about $256. I was of course wrong, in that I counted 8 chips rather than 16. The correct figure for the chips - (I just checked) is $529.60. This assumes quantity 16k purchased from a small manufacturer I know.

Sorry for the misinformation.

When the Mac is busy doing something time-consuming, it puts up
a wrist-watch cursor. I would like to use this cursor, but have
not been able to capture it by a screen snap-shot, because the
snapshot event is queued until after the reason for the watch
has gone away. (Not surprising). Although it does not seem
to difficult to design this thing, can anyone save me the trouble
by sending me the bit pattern for this cursor?
(Striving for consistency, I would like my cursor to be exactly
the same as other software is using. If I guess, this probably
won't happen.)

A different question: How does one get updates/supplements to the
Inside Macintosh documentation. We bought Inside MAC a few months
ago; today my program needed to know the time. I found reference
to a routine GetTime in one of the programs that has been distributed
on the net, but could find no mention of this anywhere in Inside
Macintosh. Or any other description to time, clock, etc?
There must be updated documentation coming out of Apple. How
does one keep up?

According to the latest issue of Macworld (November, 1984) Apple is
leasing two additional buildings that will, among other things, handle
the "manufacture of an as-yet unannounced product." Clue One.

This weeks's edition of Computer & Software News, a retailer's publication, claims that, in January, Apple is planning to introduce a Mac with more inside space for an internal hard disk *like the Lisa 2/10* and possibly a second internal drive or something along those lines. Clue two.

What are these clues leading to? It is only a rumor - but some believe that Apple is trying to expand the stretch of the Mac product line and drop the Lisa series, for which little new software is being written. The new machine will (would?) standardize the Apple-32 product line. One of the problems with the Lisa is that the pixel-size is different, which distorts Mac graphics under MacWorks. Yes, the Lisa is a very powerful machine, but it would have the best of both worlds as a super-fat Mac.

If this is indeed true, how do present Lisa owners feel about this? They certainly put down the chips for their machine, and will Apple leave them in the lurch by dropping the machine from its product line?

Another thing: When Apple finally introduces its 800K double-sided drives,

(1) Will the 800K drives accept 400K disks?
(2) Will the 400K drives at least accept 1 side of an 800K disk?
(3) Will the Finder treat the front and back as a single entity or as two separate disks?

To wrap it up, a few-month-old issue of Byte (Macworld would never print something like this until much later in the game) said that Apple is working on a color Mac for spring, 1986. Problems to overcome are (a)cost (b)high temperature of color tube and (c)fixing these problems without sacrificing resolution.

*** In the never-ending search for more Apple-Ications...

I am in the process of deciding between purchasing a Lisa or a Mac, and have several questions which the salesmen have been unable/unwilling to answer. Please MAIL any answers to me; I am just starting to read this newsgroup (we haven't got fa.info-mac or net.micro.apple.mac here yet), and I realize that these questions have probably come up before. I'll be happy to forward the answers I get to anyone who asks.

1) On the Mac (and, I assume, with the Fat Mac), the amount of information one can write with MacWrite is dependent on the amount of

memory. Is the same true of LisaWrite, or does it have some system for swapping text off and onto the disk? Will MacWrite soon have some type of virtual memory system?

2) I've heard rumors that the Lisa Operating system cannot access the new Lisa 2/10's hard disk. True of false?

3) Are there any significant differences between the capabilities of MacWrite and LisaWrite, and MacPaint and LisaPaint (and LisaDraw)?

4) Any opinions on the other facilities (especially the LisaTalk modem system) of the Lisa Office software would be appreciated.

5) Does anyone know whether the Lisa software will have a new revision in the near future?

6) Given the following priorities (pretend like money is *hardly* any object), which would you choose, the fat Mac or the Lisa?

    1) Word processing with fancy fonts.

    2) Drawing and art programs.

    3) Being able to combine the two (i.e. letterheads w/art, etc.)

    4) Virtual terminal capability.

    5) Some sort of home use database system.

Programming with either does not seem to be a consideration at this time.

Thanks in advance for any help -- it is appreciated!

    Just when you may have thought it was safe to purchase a
    512k Mac and not have to worry about future upgrades comes
    this disturbing aside in the October Dtack Newsletter:

    "... the genuine Fat Mack, which was (and still is?)
    scheduled for production early in 1985 was to have had
    a logic board redesign to quadruple the data rate of
    its serial port, for instance. Introduction of the
    'Plump Mack' this early reeks of a desparation move to
    placate frustrated software designers.

    Incidentally, going from 128k to 512k is a 384k upgrade
    regardless of what prevaricators may say."

    I must include the following subscription notice for
    permission to reprint the above:

    "SUBSCRIPTIONS: ...$15 for 10 issues in the U.S. and

Canada (U.S. funds), or $25 for 10 issues elsewhere.

Beware; military hardware tends to use components with much better
hermetic sealing than "commercial" grade ICs and such.

I was really surprised the other day when I walk into a local
computer store and saw a Lisa 2. I was surprised because I totally
missed it's announcement. When did Apple announce it? Did they make
any major changes in it besides the disk drive??

Just another thing for the net to dwell on: I have been given to
understand that user group "A.P.P.L.E." has made available a how-to
manual for the "technically inclinded" to do a home upgrading job
for their Macs. I don't know how this would effect their warranties.
If people are really dying for this info I will try to get some more.

< take that, green dragon>
Does anyone have a terminfo entry for a Smarterm][80 column card? I
have been having trouble running it at 1200 baud against AE Pro, and
in addition have found that my Multiplan and VC/80 expanders do not
have this new version of the ALS Smarterm defined. A bummer!

Any help at all would be welcome, both for the terminal emulation and
for the VC and Multiplan,

Frank Webb <cbdkc1!fran>

Modula Corporation was supposed to have shipped their Macintosh Modula 2 a couple of weeks ago. I've seen no comment on it. Did they ship it? Does anyone have a review?

Thanks.

Has anyone else noticed that the Koala pad for the IIe/IIc seems to develop
glitches when you move the stylus too fast (where 'too fast' is defined as as
fast as you would move a pencil point while doing careful hand printing.)
It skips over the area in between the end-points of a line.

Is this because the Apple is not sampling the outputs fast enough? or what?

<swat>

Re: Character arithmetic done in 16 bits.

    Someone can correct me if I'm wrong. But it is my impression
    that the specification of C states that characters will always
    be converted to integers when used in expressions. Which
    is annoying on an 8 bit machine, but standard none-the-less.

My main complaint about Aztec C is from a portability standpoint.
The compiler speed I can cope with (particularly since I started
using my spare 64K as a ram disk), and the execution time is
reasonable, but there are major problems with the I/O other than

just speed; as follows:

Aztec C does not buffer it's keyboard input. When you're UNIX C
program says "read(0, buffer, bufcnt)" it expects that someone
will have done erase and kill processing first. Not so in Aztec
C. The only C routine that does processing is "gets()". I don't
know about you, but that certainly is not the routine I generally use
when doing UNIX I/O. Furthermore, it's buffering does not appeared
to be the same as the processing done by the shell. The shell
looks at the device specification to get the erase and kill characters.
I don't think "gets()" does.

So here goes my question:
    Has anyone implemented a new set of I/O routines that DO do buffered
input?

And, while I'm at it:
    Does anyone have a serial driver (or ANY driver) that works with
the CPS Multifunction Card? (preferably one that accesses the chip directly,
my batteries keep running down (or else someone is clobbering the state)
so that the default speeds are never right; but anything will do).

                                        Thanks,
                                            Kee Hinckley

Code-wise, most stuff should work with the CMOS processor. However, you will
not be able to install this in a II+. The reason is that the CMOS unit
is clocked for 4 meg, and the slowest available version still runs at
2 meg. Apple themselves had to modify the bus timing on the IIe to handle
the 6502A, because the data windows were already gone by the time the bus

tried to accept valid data (hence, the inability to run very time-picky
Spiro-disk protected software). As far as I know, there is no version of
the II+ (or the 65C02) which is compatible.

<swat>

If your problem is that VI doesn't use the top half of the screen
or top two-thirds) then I would guess that the problem is actually
a feature of VI. What happens if VI looks at your baud rate and
says, "You poor soul, you're only running at 300 (1200) baud. Rather
than make you sit and watch as I redraw the screen everytime you
do anything, I'll make like easier for you and only use 2/3ds (half)
of it."

If that is your problem, the fix (if you want it) is to add a line
to your .exrc (or EXRC variable in the Cshell).

        set wi<[ndow]=24

And there you go.

On the other hand, if this doesn't sound like your problem...
...I haven't the slightest idea what you should do.

In BYTE october 1984 page 16 there is an advertisement of MANX's
Aztec C offering among other things a Resource Editor.
Isn't this true?? Or can't it be used to create new resource files??

I'd like to hear more about Aztec C anyway. Is it useable
as a development system (instead of a LISA for example)??
Is it possible to use *all* the routines described in the
Inside Macintosh documentation?

Thanks in advance!
Rick Jansen

[It is pitch black. You are likely to be eaten by a --]

     Modula Corp. is holding back on release pending repair of a few
bugs (this, at least, is what they told me). You can, however, get a
beta-test version. Call 1-800-LILITH2 (i.e., 1-800-545-4842) for info.

Losing the Koala pad readings in between as you describe does indicate
that the Apple isn't sampling fast enough...but this is a problem in
the software you are using. I have used Logo, Pascal, and Basic to
take Koala pad (and joystick) readings...Logo is slowest. I've used
some fancy Koala pad software that I think came with the pad...its
sampling routines are probably in assembly, and it hardly ever loses
readings.

Once, I used a cheap VOM to see how linear the pad's readings were with
respect to pen position. I'd say the limiting factor in that case was
the needle response in the VOM, never the pad.

Well, as an experienced Apple user, I know that Apple cares about its
users and still keeps its "experienced" users satisfied. Its sounds to
me like you just seem to be mad because possibly something bad happened
to you. Maybe you were just one of those "dumb" users that somehow got
ripped off because you didn't know what you were doing.

Then again -- maybe I'm wrong.

I bought an 80-column card from a place here, which went out of business, 2 weeks after i bought it. OK, now the problem, when i try and boot my visicalc program, certain sectors of the screen have some kind of bizarre static. It is in some sort of pattern like large blocks of static, and I have no idea what is causing it. It seems to work fine in normal operation- only problem when i use visicalc.
And the thing is, no other Apple dealer will fix it because they say this shop was officially closed before I bought it so warranties are no good.

Any help on this would be greatly appreciated.

My system is:
Apple IIe
Apple's 80-column card
and disk drive etc.

Thanks in advace
Rob Cook

Apple has reduced the price for Inside Macintosh to $100. The reduction
is due to economy of scale in production of the documents.
To quote the Apple Mac Developers Group:
     "...demand for Inside Mac has increased ...largely due to the
growing availability of native Mac languages...[it] is essential for any
serious development work.
     "Because of the increased demand, we've been able to...lower our
costs."

     Other details of availability, updates etc. are unchanged.

Subject: vicmodem to rs422 conversion

I just got this working!!! It only cost me $1.60 for the 9 pin connector since I already had the $59 vicmodem and scrap parts. Some will scoff but this is a poor man's modem for the Macintosh. A bit slow (300 bps) but when the wife watches the budget you have to start somewhere. I also have a home-brew auto dial circuit but I haven't converted that from the vic to mac yet.

-----RS422 (+5 volts line driver/receiver)------

MAC	function	breadboard	VICMODEM	function
1	ground	ground	1, A	ground
2	+5v	pwr to ic	-----	
4	TXD+ -->	3.3k pullup -->	M	data to modem
5	TXD-	----	----	
6	filtered +12v	----	10	modem power
7	carrier detect<-	LS04-6 5 to <-	H	carrier detect
8	RXD+	----	-----	
9	RXD-	<-- LS04-4 &1k res., 3 to <--	C	data from modem

```
back of mac
-------------
\ 5 4 3 2 1 /
 \ 9 8 7 6 /
  --------
```

The MAC book (red cover) seems to say you can run the rs422 lines open ended like this. They talk about doing it with the imagewriter.

Does anyone have a termcap entry for an Apple][e running
the extended memory, 80-col card? Please mail directly to
me (I imagine this is the nth time someone has requested this.)

Also, someone complained in private mail that the above card
is too slow for effective 1200 baud use. Does anyone else
have any experience with this card at 1200 baud? I
briefly glanced at the Rom listing for the card and it does
look slow for page scrolling.

Just when I think I might graduate from being a MacNovice, I run into
a dead end again...So again I ask for help from the MacHackers on the net.

I am trying to use the 4 tone sound generator, using the routine
StartSound(&soundtable);
This is starting the sound correctly, but the routine does not return
until the duration has run down. What I want to do is start the sound,

then return and modify the waveforms/rates and keep updating the duration
to produce continuous sound...
Am I using the wrong routine? or am I using the right routine incorrectly?
or is it possible to do this?

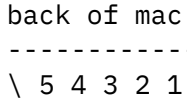
Subject: Commodore to Mac Null modem cable

I recently posted the interface below to the net. It works. Since
then I've added a second cable that after unplugging the modem allows
one to interface direct from the Commodore to the Mac. Its'
description is listed below the first.

 -----RS422 (+5 volts line driver/receiver)------

MAC	function	breadboard	VICMODEM (conn. 1)	function
1	ground	ground	1, A	ground
2	+5v	pwr to ic	-----	
4	TXD+ -->	3.3k pullup -->	M	data to modem
5	TXD-	----	----	
6	filtered +12v	----	10	modem power
7	carrier detect<- LS04-6	5 to <-	H	carrier detect
8	RXD+	----	-----	
9	RXD- <-- LS04-4 &1k res., 3 to <--		C	data from modem



```
                \ 9 8 7 6 /
                 --------

 conn. 1          signal         conn. 2 (to CBM)

  1,A              GND            1,A
   M               TXD -->         C  (RXD)
   C              <-- RXD          M  (TXD)
   H  to GND     carrier detect    H to GND
```

So now I can type on the CBM keyboard and everything appears on the Mac screen that I type. Big deal! Only problem is it doesn't work the other direction. I'm sure I don't have any faulty connections.

Q. Anybody know the answer to the above problem?
Q2. Is there a way for the Mac to receive and store M-Basic files via the modem port? I have a lot of files without peeks and pokes that I could use if I can do this.

After waiting for five months, I can finally use Prodos!

The Prodos Technical Reference Manual is now apparently back in print. I was able to purchase a copy at my local computer store for $25. I have skimmed the manual and it seems to have all the necessary information for assembly programming. There is even a return card in which Apple says they will attempt to keep registered users informed of changes (I will believe this when I see it).

The parameter format for calls to the Machine Language Interface (MLI) is a bit strange to me: The first parameter of each call is the number of parameters to expect. The manual says this is to guard against accidental calls to the MLI. Is this practice now being pushed by anyone besides Apple? This is the first time I have encountered it, and think its a little silly but harmless.

A very, minor flame: The manual is distributed in looseleaf form. The pages are smaller than normal 8 1/2 X 11, and are wider than my one small notebook likes. Apple says they did this to make updates easier and binders are available at extra cost. The loose leaf style is good for updates especially if the updates are issued in the form of "replace this old page with this new page", but the first set of updates which came with the manual contains several widely separated page updates on one page so you can't really just replace the offending pages.

There has been a great deal of talk about the new (disk-based)
Macwrite. When, where, and how will the upgrade be available? (As
usual MACWORLD seems to believe that it is out now, but nobody
in So. California seems to have heard anything about it)
Also, according to the MACWORLD article, on 128K Macs, there is still
some kind of a page limit (50 double spaced pages) using the new, supposedly
disk based Macwrite. Is this really true?

I have been having a problem with program stalling on the apple due
to "garbage collection" of variables, I think. The program seems to
run fine at times, then it pauses from 15 secs to 2 minutes, and it
seems to get worse the longer the program is run. I was wondering if
anybody had this same problem and/or knew a good way to minimize this
problem or cure it all together.

                  Thanks - Brent

This is a summary of replies to my request for help with getting ProDOS to
boot on a "compatible" non-Apple machine.

1. I was advised to buy the book _Beneath_Apple_ProDOS_ which has a lot of
useful info in it, including a patch that tells how to make ProDOS use

40-track floppy drives. Unfortunately, there was nothing there that I could use to fix my boot problem, but the book will get lots of use for other purposes.

2. I received a patch to ProDOS, stated to be untried by the person who sent it, which I tried. It didn't work; on a REAL Apple, the boot code put up this message: "UNABLE TO LOAD PRODOS"

3. I was advised that all ProDOS looks for in the monitor ROM is the APPLE trademark text that gets put at the top of the screen at boot. This fix was claimed to have been tested.

Taking my cue from the third offering, I made a modified copy of my legitimate Apple monitor ROM, with the lower-to-upper case foldover bypassed. To make this change, load the ROM contents into a PROM blaster and observe the data in address 583 (hex) - it is DF. Change it to FF and blast the appropriate new PROM accordingly.

This modified monitor is in my machine now, and ProDOS likes it just fine. By adding a small series of POKEs to my HELLO programme, I even have DOS 3.3 displaying and accepting lowercase commands.

Thanks to all who offered assistance!

Cheers,
Dick Binder   ("Beware the Jabberwock, my son!")

Subjece: Change startup without launching an application!

Newsgroups: net.micro.apple

You can make a Mac disk be the startup disk without running an application
on the new disk--just hold down Command-Option and double-click the Finder
on the new disk! This tip is from the RAM disk documentation. Works great!

No problem with emulating a vt52 -- I am doing it now as always. You do
need to set the parameters correctly, turn on emulation, turn off screen
formatting, and tell Unix that you have a vt52.

Apple CP/M text is not a problem, since it can can be converted from CP/M
with the APDOS program, but going the other way is difficult. I have seen
a cp/m muffin program in call a.p.p.l.e. March 1983, but I haven't tried it.
I suggest that you download MEX11 and use it for CP/M, since it also works
with binary files, which ae will never do.

I know that there is a way to replace the "Welcome to Macintosh"
boot screen with a MacPaint document. Could someone please post
it again, or mail to me if this is old ground. I have the system
utilities if that helps.

[Another Bug bytes the bus]

A few months back we had this "talk" about the Mac news flow
 and at that point people said that the Mac stuff would slowly
 go away....

                          IT HAS NOT!!!

I vote yes for a new group called net.micro.mac

Send me mail . . . I   L O V E mail

          Josh Siegel

 {convex,ucbvax,gatech,csu-cs,anl-mcs,lanl-a}!unmvax!unm-cvax!josh

P.S. It might not matter... A Ex-friend just watered his plants and
      my apple while I was using it.... ZAP! Now it is time to pray.

Forgive me if I already posted this, but....

APPLE COMPUTER

"16-bit Apple II chips due", INFOWORLD, Nov. 5, 1984, pp. 21-22.
    New 65816 chips will run all existing Apple II software and give Apple the 'absolute advantage'. The 65816 can address more than 16 M-bytes. Designer Bill Mensch of Western Digital Design predicts that the 65816 and its 8/16-bit sister, the 65802 will help to 'kill off the mainframe industry'.

I'm sure those who read Apple's ads in the Newsweek
election edition (you know, the edition with Apple ads *only*!)
saw the latest marketing gimmick called "Test-drive a MacIntosh"
The ad said that "qualified persons" could go to a "participating
dealer" and take a Mac home overnight and play with it.
Wondering who the "qualified persons" were, I called my nearest
"participating dealer" and asked. Apparently, you are qualified
if you hold a Visa or Mastercard, and are willing to have them
fill out a charge slip for whatever the price of a Mac is.
They hold the charge slip overnight, then give it back to you
or tear it up when you bring it back.
Our participating dealer has four Macs available for loan,
and it throws in four pieces of software for the "test drive" --
MacWrite, MacPaint, Multiplan(TM of Microsoft) and something
else that the salesman didn't know about at the time.

Anyone bite on this offer yet? If and when I do, I'll share
my experiences.

I believe that the people in net.micro.apple who have wanted to make it strictly Apple][information are probably justified now that net.micro.mac is up. So unless it pertains to all of Apple, not just Macs :-), one should probably post Mac articles to net.micro.mac.

Shouldn't one?

I too have been using AE pro to use Unix... emulation works well
except for tabs. Also, I found out that emulation doesn't work
without an 80 Column card. Such is life.

CP/Muffin is a horrible program. It made scramble eggs out of
a Turbo program I wrote. Yuck! There has got to be a better
way.

Does anyone have a patch for macterminal that will make
it easier to type a ~. Pressing three keys at once
(command-shift-tilde) is not a very good solution for
a character that comes as frequently as tilde on
Unix (mail, rlogin, tip, cu, ..).

I'm trying to use MODEM7 with an Apple II+ and an Apple Super Serial Card.
I've tried writing my own code to talk to the serial card but so far
have had no success. The card works fine but sometimes locks up and won't
receive data properly. I know I'm doing something wrong but I can't
figure out what it is. My code is just a Z80 version of the appropriate
6502 ROM code listed in the manual.

Does anyone out there have a working overlay file for this configuration?

Thanks in advance.

Lately I have had an intermittent problem with an Apple 2+. During booting
the APPLE][logo changes to aPPLE][, or a single extraneous character
, usually ! but sometimes) 0 ` appears on the line below the logo.
This aberration is often in the display as it comes up, but sometimes appears
 within the
first second or so after booting an empty drive (afterr the head zeros). If
 a disk is in the drive, it often boots incorrectly during such behavior.
Looks like a memory problem, but the bits involved differ. Has anyone
experienced a similar problem? Any guesses at the solution?
Additional info:
Once a successful boot occurs I can do RAM checks all day with no problem
and can do a PR#6 successfully. It appears to be a cold boot problem.

I am looking for nitty gritty technical info about the Apple IIe. Listings
and commentary on the monitor (both the IIe monitor and the older one for
the II+ which allowed single stepping programs and didnt destroy memory when

it got a reset) Also, listings and commentary on either or both of the Basic interpreters (Applesoft and Integer Basic).
I have heard tell that there was once a ~700 page technotes from Apple that was reproduced and distributed by International Apple Core. IAC says that they have no more copys, and no plans to produce any more. I sure would like to get my hands on one though!

Does anybody have one they would be willing to sell or lend me?

While I am at it, does anybody have any technical information (Such as circuit diagrams and listings/commentary of the firmware) for the extended 80 column color card (The one that supports an RGB monitor and double HIres graphics.)??

[decisions -- decisions]

With all the latest upgrade announcements and predictions coming out for the Mac, I think this is an exciting and confusing for Mac owners. For example, I am trying to upgrade my Mac System and the next step is no longer a simple choice.

I have a "slim" Mac with just the one disk drive. I have been saving my nickles and dimes intrying to improve the system. I thought that I would try to get an external disk drive first, and then get the memory upgrade. But now there are announcements/rumors of a double-sided disk drive Real Soon Now and possibly a decent hard disk system. I've even heard rumors of

another upgrade for still more features.

Now I know that with a new machine like the Mac, there will always be improvements along the way, but I am still unsure of my next step. I would be interested in hearing what other Mac owners think of as the logical system improvement path.

Mail or post responses. If I get enough mail, I'll post results to the net. Thanks.

[Row, row, row your bits, gently down the stream...]

I received my Inside Mac and Software Supplement on Oct 30th after mailing check on 10/15. The documentation is massive. Two large 8.5x11x3" apple binder with dividers bursting with information and few examples. Sections include:

Volume 1
Introduction
User Interface
Road Map (Index)
Mem. Man. Intro
Assy Language
Resource Manager
Quick Draw
Font Manager
Event Manager
Window Manager
Control Manager
Menu Manager
TextEdit
Dialog Manager
Desk Manager
Scrap Manager
Toolbox Util.

Volume 2
Packages
Printing
Memory Manager
Segment Manager
OS Event Manager
File Manager
Device Manager
Disk Driver
Sound Driver
Serial Driver
Vertical Retrace
System Error
OS Util.
Other OS
Applications
Example Programs (Pascal)
Putting Together Mac Applacations.
Index (for everything)
Floating Point
Debugging
Macintosh, misc.

I also ordered 'The Software Suplement'. This consisted of 10 disk of which 3 we Mac and the rest for Lisa Workshop. The MacStuff disks included:

MacStuff 1
Resource Mover
Hex Dump
Disk Utility
Boot Configure
File Set
Alert/Dialog Editor
Examine File

Printer (?)
Hard Disk Install (MacWorks on Lisa)
Screen Maker
Icon Editor

MacStuff 2
Font Mover
Font Editor (Can't get it to work, but havn't tried hard)
Fonts file
Edit (Text Editor)
Grow (?)
Sound Lab (Real neat!)
Life (Game of)

MacStuff 3
DB, MacDB (debugger)
(Debugger files)

All in all, well worth the price. $150 for "Inside" (Now $100) and $100 for "The Supplement". This price gets a real copy of "Inside" sent to you when complete. There is no info on hardware.

I'm looking for an educational program for my 3 year old son. He

already knows the alphabet and most of the numbers. I was thinking
of buying Spinnaker's Kindercomp, but I would like to find out about
other possibilities. Channukah is coming soon so fast replies would
be appreciated.

I have an Apple II+ with 48K and want to run a program that requires
about 50-60K. The program would not run on my system as is. I got a 16K
RAM board, and was able to load the program and attempt to run it.
Unfortunately, the program was written for a IIe, which has built in
up, down, left and right cursur controls on the keyboard. The II+ only
has left and right. To run the program, I need all four. The left and
right work fine, but I can't get the cursur to go up and down. The up and
down controls are in ROM which is zapped by the RAM board. Is there any way
I can get up and down without the built in ROM???

In this week's Infoworld (Nov 26) apple has an ad that says

"If you're one of the 2,000,000 owners who've made
the Apple II, II+, IIe, and IIc the world's
leading family of personal computers, please
call: 800-862-7753."

Can anyone south of the border tell me what happens if you call? Do you win something? :-)

Thanks

****
You buy alot of software to do things for your kids on the Atari.
However, you might consider going to the library and getting copies
of Compute or some other magazine that supports Atari. These
magazines have alot of low level programs for education. The fun
thing is to work on the program yourself and have the kid there to
work with you some. I found that I and my kids have had some good
times doing this.
****

I know you didn't ask for advice, but ...

Wait for your son's bar mitzvah to give him computer stuff; let him enjoy
his childhood.
Get him a boxful of puzzles (the old-fashioned wooden kind) better. He can
share them with his friends and learn some social skills; that will serve
him better than the little he'd learn from any 'educational' program.

[Computer literacy is a great big crock, anyway. By the time your son grows

up enough to really need a computer, it won't look like a computer - if it does
it won't do anything useful.].

I may have flamed a little here, but I am serious in the gist of it.

Thank you for listening.

****

My son is 3 like yours (born in 8/81). He knows the letters
and numbers (from Sesame Street no doubt).

I have Kindercomp and Facemaker from Spinnaker and My
Letters, Words and Numbers from Stone. Kindercomp is OK,
none of the games are outstanding, but there are 6 of them,
so it's an overall good value. Facemaker I think is a
little too rigid, but an older child might enjoy the
guessing game part (it's like the game Simon of years gone
by). MLWN is basically introduction to the keyboard with a
cute animated graphic (one for each letter of the alphabet).
I enjoyed it, but it grew stale fairly quickly, though it
did teach my son the keyboard.

I'd be interested in other replies you get.

Summary:

In article <emory.1436> km@emory.UUCP (Ken Mandelberg) writes:
>Does anyone have a patch for macterminal that will make
>it easier to type a ~.

Using Fedit open MacTerminal. In block 7 at position 150 is a row of
16 characters, mostly periods, with four ` and two ~. These sixteen
characters are the table for the ~/`/Esc key. I changed it as follows:

Starting at position 150:

```
     HEX  1B60 7E7E 1B60 7E7E 7E60 7E7E 7E60 7E7E

      ASCII  .`~~.`~~~`~~~`~~
```

The first 1B is the unshifted key.
The second 1B is with caps lock on.

The four ` are the command, caps lock-command, and either option &
command.

Any key combination with the shift key pressed will generate the
tilde.

I renamed the file MacTerm to distinguish it and placed a note in
the get information. Thus I can always spot the modified version.

Subject: Commodore to Mac Null modem cable

The first chart below works for connecting a Mac to a Vicmodem. The second chart is a null modem cable for connecting a Mac to a Vic20 or C64. I just got it working. What this does is (1) saves me $471 since I already have a dot matrix printer connected to my Vic (2) saves me $1600 since I can use the Vic to debug Mac SW without buying a 2nd Mac.

-----RS422 (+5 volts line driver/receiver)------

MAC	function	breadboard	VICMODEM (conn. 1)	function
1	ground	ground	1, A	ground
2	+5v	pwr to ic	-----	
4	TXD+ -->	3.3k pullup -->	M	data to modem
5	TXD-	----	----	
6	filtered +12v	----	10	modem power
7	carrier detect<- LS04-6	5 to <-	H	carrier detect

```
   8      RXD+             ----                -----

   9      RXD-  <-- LS04-4 &1k res., 3 to <--  C       data from modem

               back of mac
               -------------
               \ 5 4 3 2 1 /
                \ 9 8 7 6 /
                  --------
```

Null modem cable:

```
 conn. 1          signal         conn. 2 (to CBM)

  1,A              GND            1,A
   M               TXD -->        B,C  (RXD)
   C              <-- RXD          M  (TXD)
   H  to GND     carrier detect    H to GND
```

So now I can type on the CBM keyboard and everything appears on the Mac

```

[two wrongs don't make a right, but three rights make a left]

I recently bought Aztec C for the Apple and have begun to write some graphics routines. I added lo-res graphics first, since they were easiest, then I started work on the hi-res stuff. Before I spend a lot of time on this has anyone written a graphics library in C for the Apple that they would be willing to share? For those of you who have written graphics routines, did you write them entirely in C or did you use assembly language? If you used only C, how do your routines compare in speed with say the Applesoft ROM routines or the

Turtlegraphics routines from Pascal? I'm really interested in getting
a good graphics library for the Apple running under C, but I don't
want to repeat what someone else has done if I don't have to.

If nobody else has tackled this project and I go ahead and finish my
work, would anyone out there be interested in this sort of thing? I
already have some utility programs that I could post/mail if there's
sufficient interest.

Does anyone out there in netland know anything about a board for the AppleII
called the "PDQ Super 32 System?" It is a 68000 coprocessor from a
firm called Enhancement Technology Corp. Given the right options, you can
get enough software for the rest of your natural life. This can include
Unix version 7 (or a facsimile thereof), p-system, CPM w/C compiler, and
lots of other stuff.

Question: Is this for real? Anybody had any experience with this product,
or with any of this company's products?

Thanx in advance for the help.

..
  Does anyone out there know how to use modems with UCSD Pascal?
It ought to be modem independant, but just for the record I am using
a Pace Mastercard RS-232 card with a Pace Nightingale modem.
  I have tried opening files to 'remin:' and 'remout:' and using
'read's 'write's and 'unitread's and 'unitwrite's but to no effect.
Can you use modems with high-level commands, or do you have to sink
down to machine level?

  Any help would be greatly appreciated,

                              Tim Bissell, University of Warwick
                                 England.

I'm thinking of purchasing a Fat Mac w/2 drives to use as a software
development system, and I'd like to get some feedback on the feasibility
of such use. In particular:

1. Is the Mac Assembler/Debugger a viable software development tool
   for machine language programming? Has Apple produced a reasonably
   bug-free version, able to handle large source files, with linking
   capability, and so forth?

2. Are there any worthwhile implementations of C available for the Mac?
   (E.g. how do they shape up as regards portability, size limitations
    on source code, Kernighan&Ritchie adherence, etc.)
   I've heard of a Unix C, from Holt/Stanford, which requires a Vax
   to utilize; has anyone had any experience with it? Are any C
   compilers compatible with the Mac Assembler?

I realize some of these questions may be naive, and some may have
already been answered on the net; please bear with me.
I'd appreciate any information, rumors, pointers in the right direction;
please respond by mail to
     ...!ihnp4!wucs!wuibc!etm

Thanks in advance,
Ed Macke

Has anyone used Transend EasyCom/EasyGo? If so, what did you

like/dislike about it? How does it compare to other communications
packages you have used?

Please reply by mail. I will post a summary if there is any interest.

Thanks,
Steve Fine

I have recently been victimized by either a power line and/or telephone
line glitch which took out my modem (Hayes Smarterm 1200) and my serial
card (CCS 7710). Having repaired both, I need advice on protection
devices to prevent a reoccurance. (Murphy says lightening will strike
twice.)

I recall seeing an ad for a power strip that contained filters for
both the power line and the telephone line.

Does anyone out there have knowledge of these protection devices?
Do any of them actually work? I would appreciate any recomendations or advice.

Jim Kent

I'm a][+ owner, but a friend just bought a Mac and asked me this.

Does anyone know if there is, or if there's going to be, an incarnation of
Kermit for the Mac?

Please reply directly - if there's anything usable, I'll post it to the net.

Thanks.

Cheers,
Dick Binder   ("Beware the Jabberwock, my son!")

I have a Mac and I want to take it to Australia. Does anyone have
any experience of transporting a Mac on a plane? I want to know:

(1) Is it safe to check-in the Mac (on the plane) using the box
it came in?

(2) Should one buy some special insurance to cover the Mac?

(3) Can one buy a transformer in the USA for using the Mac in
Australia (220 Volts)?

Thank you.

This request looks to me suspiciously like that of an aspiring pirate; if you
have a legit copy of Apple CP/M, then you should have the program called
APDOS, which comes on the Microsoft disk and is described in the Microsoft
documentation.

Cheers,
Dick Binder   ("Beware the Jabberwock, my son!")

>>

At Comdex I saw all the C compilers for the Mac and talked to a reviewer doing a review. These are the benchmarks that he had for the sieve program that was in BYTE last year.

	execution speed	file size	compilation/link etc.
Megamax	6.2 (4.17 reg vars)	5k	105
Softworks	7.0	25k	300+
Consulair	10.0	12k	125
Hippo	60+	?	N/A

He had not recieved the Manx compiler yet, but I talked to them and they do not have the capability yet to create a Macintosh type executable file (you must use their shell). The Megamax and the Softworks are the other two K&R compatible versions. The Consulair does not yet have floating point.

The Megamax C compiler has in-line assembler and the compiler produces object code directly. Thus, there is no need for the 68000 developement system. The people at Megamax said that Apples object file format is still under discussion and they will convert to it when it is decided upon. The Megamax C compiler allows dynamic overlays and so I doubt that there is any problem with compiling very big programs. Also it is the only compiler out yet that has a librarian and the ability of the linker to link in just the routines that are called (this explains the small code size).

I don't know their address but Megamax's phone number is (214) 987-4931

If your modem gets zaped by glitches, check that protector block where the telephone line comes in is properly grounded and that the carbon blocks are in good shape. Inspect the blocks by removing the two bolts on the protector that appear to do nothing.

After having lost two modems to lightning this way, I found that the Telco did not ground the protector when my phone line was installed. Ameritech did reimburse me (after a bit of a delay) for the modem repair charges.

I find it amazing how many people jump to the conclusion of assumed piracy as the result of a simple request. There are *several* flavors of Apple CPM. Microsoft is only one of them. Yes, many of them probably do come with an Apple DOS-to-CPM conversion utility. My Z-80 card, made by PCPI, marketed by MICROPRO, CPM by Digital Research, also includes such a utility. I would imagine that this is not universally the case. I seem to recall that some 3rd party Z-80 cards come pretty bare-bones. I do not think that DR makes a CPM-DOS utility a standard part of the CPM OS it sells

. This would leave it up to the 3rd party licensee to provide such utilities. Not all do. Didn't DEC fail to provide a disk formatting utility when the Rainbow first came out? Besides, why would a "pirate" copy only part on the CPM system disk when other utilities are sitting there waiting to be "plundered"?

   As to the requestor, I believe that InCider magazine published the listing of such a utility sometime in 1983. I'm sure there are other public domain sources as well.

A friend of mine just bought a Lisa 2/10 to run Unix on; however, with the Lisa he also got a copy of Macworks. It seems to run with no problems, but he is so far unable to get anything to print via Macworks on his Imagewriter. The manual always points to the Lisa's "preferences" Icon, but of course this is non-existant on this system, as there is no Lisa Op system. Does anyone know of a way to set the printer specifics in Macworks; or, for that matter, how does one tell a standard Macintosh that it has a letter-quality (i.e. non-dot-matrix printer) connected to it? All advice gratefully accepted.

Does anybody out there know the cost per minute of the various dial-up
services and the general quality of each. My impression is that for
most home computer users, these services can be very costly (like .5-1$ per min)
so that a typical session (1/2 hour can cost you $15-20 bucks). I need this info
for Christmas so any help on this would be appreciated.

| Re -- Anybody have a copy of the Apple tech notes from Intl Apple Core ?
|
| I would be interested to get my hands on the pin designations for each of
| the expansion slots. I want to do some D/A stuff but want to build my
| own interface (half the fun). However, I don't want to pay apple for my
| own work and besides it seems no one carries tech manuals like that since
| "no one makes their own hardware."
| Grrrrrrrr.
|
| -From the padded terminal of ><..!decvax!ittvax!sii!dmcnh!gts

Thanks for the offer. What I really need is the schematics and
listing of the rom firmware for the extended 80 column COLOR card.
The one with the RGB monitor interface and the double hi-res graphics
firm/hard-ware.

But I would also like to have as much technical information about the
guts of my Apple as I can get. Hence the request for the tech notes
published by the International Apple Core group.

Incidentally, the pin designations for the expansion slots are given
in the 'Apple II Reference Manual (For the //e only)' Apple
Publicataion number 030-0357-A.

This manual is very good. It gives an excellent and very technical
description of just about everything you could want to know about the
base //e hardware and firmware. It is also likely to be the last
manual that Apple will be publishing in the
'old' style, with circuit diagrams and rom listings and details about
how the hardware accomplishes its magic. All new manuals will
probably be in the style of the 'Extended 80-Column Text/AppleColor
Adapter Card' manual, which tells you how to use it, but not how it
works. This speculation I got from talking to a very nice person at
Apple customer assistance in Cupertino. Her reason for saying this
was that (she said) "There are so many good books and magazine articles
being published nowadays on those subjects, that we think you should
be getting that kind of information from them, instead of us."
You can draw your own conclusions. I just report the facts as I hear
them.

Thanks!

Rick Thomas

     Yours is the second message I've seen jumping to this conclusion.
There are a number of other companies that market (legitimate) lookalikes
of Microsoft's Softcard. What software comes with them likely varies
a lot. This person may well have purchased a card that included CP/M,
but not a file conversion program. I see no reason to assume piracy.

Does anyone know if the Microsoft Assembly Language Development System (A.L.D.S.) works with a PCPI Applicard (running in a Franklin)? If not, can anyone recommend Z-80 macro-assembler package that does? Also, I have heard that the ALDS will accept Wordstar text (nondoc mode) without gagging. Is this true?

thanks

Irwin Walkenfeld (hou5e!ihw) has asked about getting the

'freebies' if you purchase a 128K Mac (a Lean Mac, perhaps?) and
then upgrade to a Fat Mac.

     If memory serves me correctly, the 'freebies' of MacDraw
and MacProject were available only to those users who purchased
their 128K Macs before September 10, 1984 (when Apple announced
their price drop).

Does anybody else out there think that Apple is making a BIG mistake with
their buyout of all the advertising space in the election week issue of
Newsweek? (I got the magazine right, didn't I?) I just get this nasty
image of many thousands of newsweek readers throwing down their magazine
in disgust because they've had it up to here with cute Apple ads. Needless
to say, not good for PR.

Companies have a multiplier to get from cost price to retail price.
Typically this number is around THREE. I think it must be around this for
Apple too. There are a number of middle-persons in the process. Try
buying directly from the factory.

I am new to the country. I cannot believe how naive people are about
capitalism.

According to Dan Cochran, on compuserve, there will be a product announcement
on the 15th or 16th of October, so we shall see..

Any bets?

The way I see it, its one of 3 things...

1) Hard Disks
2) 800K Double sided MicroDisks
3) The Infamous Apple Laser Printer.

(Personally I hope its Hard disks, which means there should be a new version
of the finder...:-)

One solution to the need for greater than 140K storage is the 8" drive.
Vista and Sorrento Valley Assoc. both make nice controller cards that
allow the use of two single or double sided drives in single or double
density. This translates to approx. 2.4Megabytes on two DSDD drives-

online. Both cards allow use under DOS 3.3, CP/M, and Pascal. The
biggest drawback is the size of the 8" drives. BUT-

Shugart has just released the SA475 disk drive for sale to the general
OEM market (IBM has had it for a while). This is a 5.25" half-height
drive that is electicaly an 8" DSDD drive. That's right- 1.2Meg in
half the space of your Apple Disk II drive... 2.4 Meg in the same space.
If the drive really does interface EXACTLY like an SA851, then the
aforementioned controller boards could be used to make a neat package.
Shugart has announced the SA475 price to be "less than $200 in quantity"
so the drive should sell for around $300 in small quantity.

Hmmm...

I swear, this "insanely great" printer has been causing an incredible amount
of discussion for an unannounced product (see fa.laser-lovers for occasional
hints, for example). Anyone have any news about when and how Apple actually
plans to announce it?

[Looks like the first one didn't get out, lets try again...]
Hello NetLand -

     I'm looking for recommendations for an 80 column card to
go into an Apple II+. I've looked in the magazines and find at
least three makers but no information as to what features each has
over the others.

     While color isn't necessary, a good solid (and steady!) B&W
display is. I presume that descenders on characters (g, j, p,
q, and y) are now standard?

     Your comments are invited.

Please use mail - if there is interest, I'll summarize to the net.

Thanks in advance.

Mark Becker

Unfortunatly I have found out that all Apples are not created equal. I have been unable to get an Applied Engineering Z-80 Plus board working on my system. AE has been very supportive. They have sent me 2 cards but neither one worked consistantly. It appears to me to be a timing problem between the Z-80 Plus and the 16K card. I have an II + with an MPC 16K card. Several dealers have told me that this is not an uncommon problem. Has anyone out there solved a simular problem. Any suggestions? If there are enough responses I will post the findings to the net.

For those who are wondering about Softworks 'C', I offer the following:

There is no way possible to edit, compile, assemble and link a program
without going to the finder and copying a file from one disk to
another.

The compiler gives error messages by line number but there is no way,
short of counting from the top, of finding line numbers in a file.

I paid four hundred dollars and got a "pre-release" version. To get
the released version, you will have to pay extra.

Printf does not know anything about windows. It sticks the text on the
screen, like a "normal" computer, no matter what else is there.

I was not able to use "create" to create a file. This may be because
I gave up early and used the toolbox version. Great for portability.

You must use the Apple linker, which has no library look-up ability.
If you want to use a routine that is in a file, you get the whole file
in your program. The "hello world" program is huge.

There is no documentation telling what routines are in which files.

It is a version of Whitesmiths.

Other than that, it's great.

I purchased a copy of ProDOS this weekend, and I have a question for the
net.

Will ProDOS really work only on a real Apple][+ or //x with a real
Apple disk controller? It fails to boot on at least some other makers'
"compatible" computers (mine among them). As nearly as I can test the
failure, it is that ProDOS looks for something in the monitor ROM when
it boots, and it hangs with its Apple copyright message on the screen if
all isn't to its liking. There may also be other checks - I think I
recall someone's having said something about the ROM in the disk
controller, but mine is authentic.

Now why would Apple display such a stupid turn of mind as to make ProDOS
behave in this way? Sure, there have been copyright infringements on
the Apple][series, but making ProDOS refuse to boot on competitive
machines is the surest way to guarantee a loss of sales. With the easy
availability of PROM blasters, it's nothing for a "compatible" owner to
borrow an Apple monitor ROM and get it copied, which is what I did to
solve the problem, but I'd venture a guess that a lot of owners will do
so only if there is a FREE copy of ProDOS waiting, with the net result
that Apple loses sales and causes ill will, too.

The bottom line is, does anyone know of any patch I can make to ProDOS
so that it will boot on a non-Apple machine?

Cheers,
Dick Binder   (The Stainless Steel Rat)

(* bug-buster *)

Here's an editted summary of the few replys I've gotten to my query about UNIX for Apple's Lisa. It is being posted to several groups because: 1) I was asked to post it to that group (net.micro) 2) I feel (I can see the flames already) it belongs in the group (68K, apple, apple32).

My original question was two fold: 1) What's available? 2) How well does it support the Lisa hardware (bit-map, mouse, etc.) Along the way I've gotten some useful info on the hardware requirements as well.

First, there seem to be two choices, a release of XENIX from The Santa Cruz Operation and a release of System V from UniPress (it's really the UniSoft 68k port they (UniPress) says). I got a reply from SCO which makes their product sound pretty nice, some highlights were:

From: ihnp4!amd!sco!dwight
Subject: UniPress System V for Lisa, reviews?
...

> Granted, XENIX is System III and not System V. However, we have a very full package for it (including a LAN, in the full standard package). From the comments that we're recieving from customers, they are very pleased with not only the quality of the software, and it's spectrum, but also with the level of support that we offer.
>
> Ignoring my obvious bias for our XENIX, I personally believe that it's the best UNIX implementation availible for the lisa, especially when one considers all that we

> have to offer for it.
>
> As I mentioned earlier, I do all of my development directly on the Lisa. I think that the Lisa is an outstanding workstation environment. And I've found that the multi-screen capability of our XENIX makes it into an incredibly powerful tool.

We support the Lisa 2. I believe that we currently ship with just the profile disks (both 5 and 10 mb). However, support will be availible in the near future for running some of the other hard disk systems that are around.

Personally, if I were buying one, I'd stay away from the Apple Profile disks. They are *slow*. One can get a reasonable amount of work done; but there are times when it gets a little frustrating. You should really play around with one for yourself and see how you like the feel of it.

For a low-cost disk system, with a reasonable amount of response time and storage, the disks like the Sunol and the Corvus come to mind. These run about $2-3K, and are much better than the Profile. Check with our marketing departments about the specifics of availibility. The address is below. Xenix on the Lisa is pretty hot, with a lot of software thrown in. Check out the multi-screen capability, as it makes backgrounding obsolete.

Dwight also included the address of SCO where he says folks should write for further information, etc. It is:

> SCO
> 500 Chestnut St.
> Santa Cruz, Calif
> 95061
> (408)425-7222

UniPress also replied. They were a bit more terse and had this to say:

From: Mike Gallaher <ucbvax!allegra!sunrise!unipress!mg>
Subject: Re: UniPress System V for Lisa, reviews?

"UniPress UNIX" is really the UniSoft 68K port of System V. It contains the full SysV distribution minus stuff like online manuals and accounting software (they are there, but do not fit on the disk). We don't have Lisp, but we do have lots of other stuff like Emacs. It is not stripped down, a la Radio Shack. Performance is about what you would expect from a 1 Meg 68K at 5 MHz (it's not a Sun!) but it is OK for one or two users. The bit map is accessible through the phys sys call, and the mouse is accessible through /dev/mouse. This is not a bad choice at university discounts.

Commentary (my own opinion on the above):
    I was surpirised how few responces I got (six, two of them from SCO, two asking me to post results.). I guess few folks are using Lisa's to run UNIX and have a net connection.
    The XENIX release from SCO sounds well supported but I've got a bais against XENIX, although I wish someone else out there could give me another glowing report. I'm almost tempted to get it. I'm not happy with the System V report, although I'd like to try it out and compare it with XENIX in terms of performance.
    Me? Well, I'm still getting the money together for the Lisa to run all this nice stuff so I'm going to keep on researching this. I hope this helps inform those of you who were interested enough to read this lengthy reply. Thanks. -Dwight McKay

Welcome to the U.S., Mr. Freed. The reason people here are so naive
about capitalism is that it is a dirty word in educational circles.
Some flavor of socialism seems to be preferred by a majority of
educators, especially at the universities.

[scratch and sniff]

Question: Does anyone know or use Anix operating system?
I saw an ad for it and was wondering what it is and what it can

do etc. I don't expect too much as it was less than 40 bucks...

[Aren't you hungry...?]

     Reliable rumor has it that Manx will soon be releasing their MacIntosh edition of Aztec C to mail order dealers, so there is reason to believe that they are not stopping their dealings with the mail order world. They do, however,p have a support line which I doubt the mail order house knows about.

All of the manx compilers generate reasonable tight code, and the 6502 has a far more orthogonal instruction set (not to mention faster) than the Z80. My bet would be on the native Dos version, though I have not tried either. In any case, my experiences with Manx have been that they are supportive and it seems to be universally agreed that their compilers are good ones.

The following is posted for a freind. He would like to receive replies to this posting. I would not.

The adds in Macworld are pretty terrible, as a rule, but most of them I can put up with. I have just seen the November issue of Macworld, however, and there are a couple of advertisements there that just appall me. On page 155, there is an ad by "Investware". Have you

heard of Bill Atkinson's program SCREENMAKER? I will post it on net.sources for those of you who do not have it. It lets you take ANY macpaint picture and make of it a startup screen that will replace the screen that says "Welcome to Macintosh". These people at Investware have the gall to charge $40.00, not for a program to make your own pictures, but for ONLY ONE PRE-MADE picture. That's just going too far.

Elsewhere in Macworld, there is evidence that people have noticed the mac font editor program that has been around for a while... Some people have actually made fonts that they think are worth $100 per font. I think that this is piracy of the worst sort, because I have about 4 disks of PUBLIC DOMAIN fonts that are just as good, or better!

Only the BEST programs should sell for as much as $100.00, and I think that the prices that some people are charging for things on the mac are simply ridiculous.

Try to get the application rmover (it comes with the Macintosh software
supplement). You can use this to "cut" and "paste" resources from one
application to another. The wristwatch cursor may exist in the system, but
if it doesn't find an application to copy it from.

!!!!!!!!!!!!!!!!!!!FLAME ON!!
Having had the chance to work on XENIX on the Lisa as well as several
different boxs, and also having worked on various Unisoft ports I
thought this would be of interest.

     XENIX IS NOT A SYSTEM 3 UNIX!!!!!!!!!!

It is far closer to a version of BSD than BTL, and BSD does not claim
to be SYSIII or later. The Unisoft ports are indeed SYSIII and SYSV
also they are far more bug free than XENIX and far more stable,
at least they did not crash the systems when I tried to use the floppy
as XENIX has done to me on several occasions.

A friend of mine has obtained a copy of XENIX for the IBM-PC after my
warning him not to, after trying to get it to stay up for more than
a few minutes he is reformatting his hard drive and sticking to PCDOS.

At least Microsoft wrote something that works.
!!!!!!!!!!!!!!!!!!!!FLAME OFF!!

In answering your question Xenix does or did not support the mouse or
any of the features Apple built in (/dev/mouse anyone?). The use of the
disk was terrible, after going in and throwing out have the things XENIX
supplied (including tar) that did not work I had about 5 meg to work with
up from 2-3 meg. I was never able to see or work on an Unisoft port
much to my regret so I do not know what they have done.

     The opinions presented are my own and not the of the company.

This is an account of an Apple][hardware problem and solution.

After loaning my][to my mother for a few months, I noticed that most of
my disks would not boot. The only ones that would boot were my 3.3 system
master and any other disks that were created after the problem occured.
Now based on the above information, what would you think the problem was ?

My hypothesis was that the disk drive was out of alignment. That seemed to
make sense because perhaps the system disk had wide enough tracks to be read
by an out of alignment drive (track-wise) and the new disks could be read
because they were written and read with the same offset. I almost tried
fiddling with the alignment screws.

Further testing by connecting my drive to another][showed that my drive and
controller card were in perfect shape. I ran a memory test and found that
a 4116 in the highest 16k was bad. The system master thought that my apple

only had 32k and wrote a 32k dos on all of my new disks.

The moral of the story is to try all of your diagnostic programs before
jumping to a conclusion.

> A different question: How does one get updates/supplements to the
> Inside Macintosh documentation.

One buys the Software Supplement. Makes sense: in order to know
how to program the Mac, you buy Lisa disks.

In addition to the Lisa disks and some MAC stuff that just about
everyone should have by now, you get the Inside Macintosh updates,
and a copy of the real Inside Macintosh, if Apple can ever figure
out what they put in there machine. (The ROM hasn't changed,
the System File hasn't changed since May. Why do we have to
wait until now to find out how to use GetTime?)

The reason that people know so little about capitalism (or socialism)
is because no human understands any economic system. The mathematical
tools that we possess so far are totaly inadequate to the task of
analysing anything so complex.

Anyone who thinks that he *really* understands the workings of
economy is hopelessly deluded.

According to Apple, you can do this upgrade to a //e, but the chip has to be
a specific one (I think NC65C02). They indicate, however, that availability
could be a problem. I'm not sure whether it'll work for a II+ or lower.
I can get specific information this weekend and will post again next week
if someone else hasn't come up with the info.

I am looking for the assembler reference manual for the
assembler used with Summacc. Our assembler for System V is
different and I would like to understand the differences.

If anyone can send me a copy of the assembler manual I would
appreciate it.

Fred Hirsch

I would to hear people's opinions concerning the usefullness of
the second disk drive on a 512K Mac system. (What functions/utilities
would be easier/enhanced with its inclusion etc.) I'd love to hear it
but I'm already overbudget on the system.

                        Thanks in advance... Kevin

Problem:
     When using MDM727 or later (maybe earlier too)

and trying to direct output to the printer (^P)
the printer never gets any data. The printer
buffer (system memory) fills with data then the
whole system becomes locked up.
Configuration:
Apple][+
Microsoft CPU (for CP/M)
Microsoft version of CP/M
Tymac parallel board

If you know of a fix for this problem, would please send
me the pertinent information. RELPY BY MAIL! I do not
subscribe to this group, I am submitting this article for
a friend.

Thanks,
Bill Retzner

I presently own an IBM PC, 256K, two double sided, double density drives.
A friend of mine has an APPLE II + with loads of software (especially games).
Is there any way that I can use his software on my IBM?
If so, how reliable, etc....?
Thanks for the info, and I will summarize to the net.

I just had my first "hands-on" look at a Macintosh digital board. What was
interesting is that the 2 ROM chips are socketed (this is a 512k board). Were
the earlier boarded completely soldered or were the ROMs socketed? There were
also areas labeled "512 only" and "128 only" (resistors in these areas).

One has to wonder if there will be another os (upward compatable?) as we travel
down the road to denser ROMs.

There is a wristwatch in the font Cairo.
Obtaining the bitpattern is easy: goto MacPaint, type the wristwatch-18,
switch to FatBits, correct the time, write down the bitpattern.

You can use this pattern in your (BASIC?)program with SETCURSOR.

It is possible to use the printerspooler with MacWrite-
generated documents:
1. Choose "print" from the file-menu in MacWrite,
   just as if you were going to print your document.
   Disable the printer by pressing the select-switch.
2. Wait while MacWrite is "saving printed copy to disk".
3. When the message "now printing etc.." appears: reset the Mac.
4. Now there is a "print file" with its own icon.
   If this file is empty you pressed the switch at
   the wrong time (sorry).
5. Start the printerspooler and print...

I don't know if many others found out the same, thought I'd post
it anyway.

Perhaps I'm being real dumb but I can't get my Mac
to look quite like a VT100 as far as the UNIX machine I'm
on is concerned. In particular, the "vi" editor
does not work quite right, many of the escape characters
for screen control appearing at quasi-random locations
on the Mac screen. I am using the standard UNIX System
V terminfo. Anyone have any ideas on what I'm doing
wrong? Please send replies via "mail" and if I get enough
responses (that work :)!) I will post to the net.

Thanks in advance,
Chris Jachcinski

Thanks to all of those who replied to my help for cleaning circuit boards:

> "My Apple motherboard has gotten quite dusty from
> running without the top, and I suspect oxidation
> has occurred to some of the socket and chip contacts.
> I want to clean up all the contacts. Is it safe to
> immerse the whole board with all chips, resistors,
> capacitors, etc. in place? If so, what cleaning

agent is recommended? Is it likely to help?"

I was quite surprised at the different methods of cleaning available.
Here is a one line summary of each method (ranked in approximate
difficulty/risk):

1) If it ain't broke, don't fix it!

2) Vacumning/compressed air.

3) Remove all chips; clean contacts with ink eraser.

4) Freon bath; air dry.

5) Soap and water bath; air dry.

6) Hutto's Blue Dip Industrial Cleaner (bath?).

7) Freon, soap and water, or alcohol bath; *** oven dry ***.

The text of most messages I received follows. (My apologies to those who
replied, but are not represented below. I seem to have lost a few
messages.)

[ed. note:I wish I hadn't lost the messsage quoted above. -- Mike Eve]
Oh, how true! My machine's keyboard began, over a period of time, to become
flaky - it'd transmit F when I pressed S, S for F, 4 for 2, 2 for 4, and so
on. The failures occurred more frequently when the weather was warm and
humid. I figured the encoder chip was bad and replaced it, with TEMPORARY
success. The new part began to do the same thing. I checked the power and
everything else I could think of, and finally in desperation applied a solvent
cleaner after blowing at the thing for a while with my lungs. The keyboard

STOPPED working altogether. I could see that it was covered with soaked-down dust kittens and other gunk, and so my last great act of defiance was to take a toothbrush to it, dislodging all that yecch, and lo and behold, I have a working keyboard again, with a spare encoder chip for use when the one in use DOES finally die. I don't recommend this course of action, but it is clear that a) solvents can do more harm than good, and b) dust, etc., can cause serious problems to an ordinary PC board.

Cheers,
Dick Binder   (The Stainless Steel Rat)

Denatured alcohol and Q-tips is a safe procedure.(Ethanol is also acceptable)
I do not recommend emersion as parts are likely not hermetically sealed.
If you must emerse, bake at 150 degrees F for at least 8 hours to dry.

good luck,
mlsmith@nadc.ARPA

==========

>From uw-beaver!tektronix!hplabs!hao!seismo!mcvax!sara70!gijs Wed Oct 3 07:59:26 1984

You can spray the board with freon. The best is to take all the chips
out of their sockets, clean their pins with an (ink) eraser, spray
sockets and pins with freon and put them back again. You can also
use this system on interface cards, but be carefull with gold
plated fingers. Use the eraser very gently on them or the gold will
disappear too. Freon should be sold in electronics parts or
computer supply shops. Good luck,   Gijs Mos @ Free University Amsterdam

==========

This may sound a bit odd, but when I was in the military we cleaned boards
with plug-in chips & everything else in place in SOAP & WATER! Has little or
no effect on most things & works well, particularly if used in an ultrasonic
bath. You do have to let it dry thoroughly, though. No "close enough for
government work" attitiude will do.

==========

>From uw-beaver!tektronix!hplabs!sdcrdcf!sdcsvax!bmcg!mikel Wed Oct 3 07:59:20 1984

I use Isopropol Alcohol 75% is ok, but if you can find 90% that is better. Use an old tooth brush and scrub. Alcohol is one of the best no distructive cleaning agents that I've found. If someone spills anything on anything, get out the alcohol. I have cleaned cranberry drink out of carpets and clothing. Computers love it too. Try to use it outside, and avoid breathing the fumes.

The other agents used in the computer industry, but are harder to get are MEK (Methel Ethel Keytone) and Freon (liquid).

Good Luck!

[Row, row, row your bits, gently down the stream...]

>From alcmist@ssc-vax Tue Oct 9 18:56:47 1984

I don't know where an individual can get it, but I have seen something that would do the job nicely.

A repairman from Leasametric fixed a malfunctioning board on one of my old group's HP terminals by spraying it with a freon cleaner. I'm not talking about the quick-freeze stuff for chilling components. This was slow-evaporating stuff that was liquid in a plastic bottle under fairly low pressure.

He just hosed down the board with the freon. It took off the dust like magic. It's chemically inert -- you can let it drip on the carpet.

I'm sorry I can't remember any brand names or suppliers. The repairman did say it was expensive.

Fred Wamsley   alcmist

Oh yes...The repairman did claim that the freon he was using stripped off oxidation. I am skeptical.   -fred
==========

     End of summary

About Hutto's Blue Dip: This tip came from some hardware types who have used it to clean ICs to improve solderability. The ICs are removed from the board, placed in a plastic tube with the Hutto cleaner, shaken for a few minutes, and, presto!, clean pins. Supposed to remove tarnish. I have been unable to locate Blue Dip locally, but here is the address if any wish to pursue it:

     The Harvey Co.
     P.O. Box 66245
     Houston, TX 77006

Normally, I don't believe in disclaimers, but, due to the nature of this
text, neither I nor my employer either endorse or warrant any of the above
procedures and/or products. You are entirely on your own!

It may not be necessary to model an economic system in great detail in
order to understand its more general features, any more than it is
necessary to model the detailed neurology of the brain in order to have
a handle on psychology.

It may be a version of V7, which *was* issued by BTL. It is not the case
that all UNIX versions that aren't BTL, or USG, or USDL, or System
<roman_numeral> are BSD versions.

Err, umm... XENIX *is* a Microsoft product...

I recently purchased a Novation 212 upgrade board for my Apple IIe, so that I can transfer files at 1200 baud instead of the 300 baud rate on the standard Novation AppleCat modem. After using the Com-Ware software to set up the 1200 baud rate, it works just fine. However, when trying to use my P-Term software, it will only work at 300 baud. I have changed the CONFIG.TEXT for baud rate from "6" to "8" and used MAKEPTDATA to create a new PTERM.DATA file. Using the "B" selection on the secondary menu, I reset the baud rate to 1200--but when I dial up and connect is does an immediate disconnect.

Changing the baud rate back to 300 with the "B" selection solves the disconnect problem, but the transmission rate is reduced to 300. Any ideas?

Well, I have some experience with Aztec c65 under DOS 3.3 & certainly agree that the compiling is none too fast. Having taken a fairly close look at the code generated, my feeling is that, on the whole, it's pretty good. I feel that it has two serious flaws, however. For one, all arithmetic operations are performed in 16 bits, even if the operands are characters. This means the the only way to get *really* fast code that does a lot of arithmetic is to delete the unneeded extra operations BY HAND from the assembly code.

The other deficiency, although this may be intrinsic to the 6502 and not the fault of Manx, is that subroutine linkage taken a whole pile of code, roughly 6-8 instructions per operand passed, plus one subroutine call at either end of the call (caller

and callee) [I'm no certain what the called "system" routine does].
Again, it is, unfortunately, impossible to get the compiler to
gen. tighter code by using chars since it insists on putting 2 bytes
on the stack per operand, no matter what.
   By the way, using their I/O package also slows things down a LOT.
I was helping with some code that really needed fast character output
and found that writing special-purpose output routine for the screen
made an incredible difference.
   Despite these objections, I like the system & plan on buying one
for my own use at home -- a DOS 3.3 version too.

   It appears that the most important issues, and reasonable solutions, have
   been obscured by the mass of vague accusations and spleen-venting flames
   (including by own). I will summarize what I feel are critical:

     1) Apple Computer misrepresented the 128k machine as being a
        reasonable memory configuration for which there would soon
       be large quantities of software.

     2) Apple Computer knew that the 128k machines would be made
        obsolete by the 512k machines without an expensive upgrade.

     3) Owners gripes about depreciation of their machines are
        unreasonable. The drop in price was anticipated by many.
        However, owners complaints about obsolence are well founded.
        To have a machine only 6 months old be shunted away from the
        main stream of new software is unreasonable.

4) Apple has announced plans to continue producing 128k Macs (at least until they can get enough 256k rams to keep production going).

Items 1 and 2 are particularly damning, and sufficient grounds to expect Apple to lose a few bucks retrofitting 128k Macs.

Retrofit with what?

Not with 512k boards, at least not for free (maybe for the cost of the chips alone).

I propose Apple redesign the memory board the way they should have designed it in the beginning. A simple board with 16 sockets and a personality module (or jumpers) to allow the use of 64k or 256k rams (or even 1 meg rams, if compatible).

Former Apple][owners will recognize the design approach. Apple did just this on the early mother boards. Three rows of 8 sockets each were controlled by three personality modules. Each row could accept either 4k or 16k chips. Talk about expandibility! From the early 4k machines to the 64k][+ is a factor of 16 -- this without a costly trip to the dealer or replacing a board. If the Mac were similary expandable, original owners could go from 128k to 2 Meg.

This new board should be given to all 128k owners, gratis, and, screw the stockholders (I myself am one, and I do not own a Mac-- I'm not that naive). All new 128k machines should be supplied with this new board as standard equipment. This will allow those on limited budgets to experience the Mac environment and upgrade when chip prices fall.

Such a simple thing, such a reasonable thing, but who ever heard of an upgradeable bar of soap?

[]

I got an official copy of MacTerminal 1.1 from my dealer. I cannot get
either "macput" or "macget" to work. Is there a new version for version 1.1?
I HAVE sucessfully used "umodem" to transfer a text file to and from the Mac
using MacTerminal 1.1, over the same phone line.

When trying to do a macput I get:

tarting handshake timeout
tarting handshake timeout
tarting handshake timeout
giving up

When trying to do a macget I get nothing.

I presently have the mac(get|put) for version 0.5 with the -o option
for the prerelease.

Thanks much...

I just can't believe the people who are complaining about this price.

Unless I miss my guess, Apple is taking a LOSS selling those boards at
that price. Is there something I am missing?

Normally, hardware products cost at least 5 times their parts cost at
the retail level. Even if Apple is paying only $20 per chip they are
in bad shape.   They have to replace the complete board, as I heard.

Now if you want a real gouge, take the original Mac. That costs less
than $200 in parts, and they sell it for $2500 in the USA. I guess they
sold it for this high price to help pay for the cost of the upgrade.

In other words, get the upgrade, you've already paid for it!

As a new owner of a Macintosh, I'm a bit bewildered by all this anger vented at Apple. I admit to some empathy to those upset by Apple's marketing strategy but I think when you're up against big blue, you have to do something to survive. Some of the stuff is a bit overpriced but I love my Mac so I guess I'll grin and bear it. I think the idea of waiting until you're sure about buying is correct. I also feel that not buying something unless you really NEED it is a good idea. NEC and some others are coming out with Mac compatible printers in the next few months I hear so I'm going to hold off on getting an imagewriter.

Q: Public domain software for Mac--I don't have a modem on my Mac yet but I'll gladly send a blank disk, SASE, or donation to anyone who can get me some uncopyrighted SW.

Q: Anyone use MacForth or do any applications programming or find out what it really takes to do 68000 assy lang programming on the thing? Also, any news on Modula-II for Mac yet? Is the Basic package any good (i.e. speed, bug-free, etc)?

Q: Is there a net.micro.apple.mac yet?

OK ... OK ... so I forgot the Mac didn't have parity ... but it doesn't
change the numbers much ... since I omited the tally of costs associated
with taking in the return, issuing credits, testing, stocking, repair ...
which certainly over $60.

For those who think that Apple can just name a price they want to pay for rams
 ... think again ... the semi producers will sell them for the highest bid.
The fact is that the semi producers are coming online faster than the customers
RIGHT NOW (and just like 1981 and 64k parts) ... but who has been shipping
256k parts in real volume (not just ramp up volumes) ... NOBODY!

Who wants to be shipping product with 256k parts ... ALMOST EVERYONE.

Anyone who can predict short run prices for 256k parts is a very valuable
person ... their are both those betting on fast fall and those betting on
a rise followed by a 12-18 month slow fall. Given pricing on other hot
semi products released in the last 4-6 years I lean toward shortages 3-6 months
out on 256k parts ... and the resulting flatness or rise in prices as
most major system houses come on line using the parts.

Sure the price will drop to around $3.50 a part within a few years ... but
that is not today.

Apple is in this market to make money ... for them to decide on shipping
product at zero markup (net loss) is VERY KIND ... for those who continue
to fume at this assertion please go back and look at Apples quarterly earnings
for the last year ... they have missed taking big losses by a hair or less.
Last Oct-Dec ... the big christmas sales ... they cleared a profit by
accident ... many of us expected them to follow the rest of the market and
declare sizable losses ... not yet but turning down profits on 100,000 mac
upgrades could do it.

As for the fella's from Fortune and Tektronics ... it's nice of you to collect
pay checks from companys that still price their 64k drams with the 1981 market,
and always ship product above a 2.5x multiplier ... it's truly nice to
throw rocks at apples profits when your own pay check comes from someone
taking what the market will bare ...

STOP BAD MOUTHING APPLE ... atleast it is still giving people jobs in
AMERICA ... and not over seas like Atari and a growing number of other

small computer makers.

If you want to set an example for charity ... start with your own pay check ...
give 75% of it to a good cause ... sell your home, computer, car, stero,
and color tv and donate the procedes to charity. Then you might have a cause
for asserting that others (like APPLE and its employees) should also be
revenue source for charity.

John Bass

The fair price for the upgrade today is $1500-$2000 ... enjoy the kindness
of Apple in pricing that IBM, DEC, Tandy, TEKTRONICS, and everyone else
aren't likely to give.

<Why is the name for "lisp" if anyone with it can't say it?>

I'm working on porting XLISP, the public domain lisp that came
across the net recently. I actually have a port of the original
version, but it really doesn't have the power of XLISP 1.2. I'll
certainly let people know when the new port is available if there
is any interest. As for commercial lisps for the apple, don't get
your hopes up. There are some out there that run under Apple cpm,
but the only one I've seen running on native 6502 didn't even have
garbage collection, and when I called the company and asked them
what lisp it was based on the salesman didn't know what I was talking
about.

Thanks to the nice netlanders my macput, macget problems are solved.

For version 1.1:
Under "File Transfer..." the selection for "Remote System" must be
"* Macterminal" NOT "o Other" for macput and macget to work. I also
found that I got into trouble by not turning off the XON/XOFF handhaking,
(1200bd) though it worked with the prerelease. If you are hardwired you should
be O.K..

Thanks to the many who responded..

     (I don't know if the original posting made it to the net.
     Certainly, replies never made it to me. If this is a
     reposting, please send replies directly to me.)

     My Apple motherboard has gotten quite dusty from
     running without the top, and I suspect oxidation
     has occurred to some of the socket and chip contacts.
     I want to clean up all the contacts. Is it safe to
     immerse the whole board with all chips, resistors,
     capacitors, etc. in place? If so, what cleaning
     agent is recommended? Is it likely to help?

     Thanks.

     (I don't know if the original posting made it to the
     net. If this is a reposting, please send replies
     directly to me.)

     Despite my previous flames about Apple Computer, the Company,
     I am buying an Apple Computer][e to replace my aging
     ][. With the low price of][e's (<$700), I will stick

with my software library another year or so waiting
for the real Mac (color, etc.).

In the meantime, I want some disk storage. I mean 140k
is a drag, and with Prodos heirarchial directories almost
totally inadequate.

Your help is solicited. I want a high-density (:=) drive,300k or more.
I know of the Rana drives. Has anyone heard of anything else?
Please also tell me if the drive will read/write standard disks
(so I can share data with friends) and how easy it was to install
the drives under Prodos (if you have it).

Thanks.

I think that the long dissertation regarding the MAC is
getting a little ridiculous.
I think people are exhibiting just a bit much animosity because
the upgrade is not as inexpensive as one would like. I think
people in manufacturing will have a better appreciation of the
cost.
What I cannot understand is if those who bought early never liked
the machine or felt it didn't fit their needs----why buy it?
Why not wait 6 mos.? I never buy the first anything.
Perhaps, the childish desire to be 'the first on the block with
a Macintosh' prevailed over the common or consumer sense of those

early buyers.

{ that should certainly generte some fire }

<is this *really* necessary?>

Help! I'm in the final planning stages of constructing a micro-based music generation system. I'll be generating samples in software and sending them to a D/A converter. Is there anyone out there who can offer some advice and guidance with respect DACs? I'd like to use the new 512K Mac (great graphics, and you just can't beat the mouse... I know, I know, I'll wait till I see a good programing language out there.), but it's only contact with the outside world is an RS-422 serial port. My questions:

1) I'll be generating samples at 10K-40K Samples per second. I'd like to use a 14/16 bit converter, so I'll need to talk to te DAC at 160K-640K bits/sec. Can the RS-422 do it? (I'm assuming for the sake of argument that the Mac will be able to send them fast enough. I won't know for sure until I see a real C or Pascal compiler, or an assembler...)

2) The DAC will need the following features:
   a) fast enough conversion

   b) ability to talk 'serially'

   c) 14/16 bit conversion

   d) (optional) I'd like to have a stereo output. (I realize that my sample rate just doubled...)Are reasonably

priced multiplexed DACs out there?

e) The converted signal will have to be filtered at half the sample rate. Since I'll be varying the sample rate from time to time, it would be nice to have this cutoff frequency set from software. Is it possible to get a filter onboard the DAC?

You may have gathered that I'm not very conversant with I/O. I'd appreciate any help or suggestions.

<>

Four weeks ago I posted a request for information on foreign language
word processing on micros. In light of the surprising amount of interest
in the subject, I would like to summarize the responses I received for
the net.

First, special thanks to each one who sent information and samples of
non-roman alphabet word processing. I regret that I was not able to
answer every response, but each of you are greatly appreciated.

Second, I have not been able to check out all of the various products and claims made. Thus I am taking each response at face value, and simply describing what has been presented to me.

Perhaps to no one's surprise, the consensus of opinion is that the greatest potential for foreign language work is on the Macintosh. The "Quick Draw" graphics package treats all text as bit-mapped images, thus allowing complex patterns like Greek letters with accents and subscripts, or Arabic characters that scroll down the screen. The only hitch is that no standard exists for non-roman fonts, and the use of existing packages outside of a word processing environment is not attested.

Keith Sproul (at Rutgers University) is advertising two Mac disks worth of public domain fonts - including math, Greek, Cyrillic, German, music, and special interest fonts. Keith is asking $12 to cover the costs. He can be reached at

Keith Sproul
698 Magnolia Road
North Brunswick, NJ 08902

S.M. Kastendiek (from Chicago) was kind enough to send me samples of Greek text produced on a Mac and Imagewriter. The quality is rather high (good for private distribution - mass printing, however, may be questionable). The Greek does a good job printing diacritical marks. I have not, however, seen the user interface for them. The diacritics software is available from Ms. Kastendiek for $25. She can be contacted at

(Ms.) S.M. Kastendiek
5760 S. Blackstone Ave.
Chicago, IL 60637

I am told that vendors are working on Hebrew and Arabic. Mark Cutter (DEC Western Research Lab?) has started on Tamil and Devanagari - two Southeast Asian languages.

The other major option for foreign language work (also no surprise) appears to be the IBM PC.

Academic Font is a card/software package that handles Greek, roman, and italic fonts on the PC. It claims to support several popular dot matrix printers, as well as the Diablo 630 daisy wheel printer. The samples I have seen (from an Epson FX-80 and an Okidata m-92) are adequate, and handle full diacritical markings. I have not seen how the screen display is handled. Supported word processors include Final Word, Perfect Writer, and Mark of the Unicorn's Edix/Wordix.

University MicroComputers
1259 El Camino Real, Number 170

Menlo Park, CA 94025

Brit Company markets a scientific word processor that (reportedly) generates characters "on the fly", and thus allows sophisticated character combinations (i.e. accent marks, etc.) by overstriking. My information here is scanty, but I understand that it requires a Hercules graphics card and a good quality dot matrix printer (like the Epson LQ1500). Apparently it prints all text in graphics mode (and thus should come close to the flexibility of the Macintosh). I believe Brit is in Philadelphia, but I am afraid I do not have their address or cost information.

For Hebrew, Arabic, Farsi, and Urdu, an Israeli company that makes word processing software for the PC is distributing through a company in Los Angeles. I have not seen any samples of their work, but I am told they are "quite proud" of their products ability to handle left-to-right languages and right-to-left languages simultaneously.

Kelmar Corporation
5456 McConnell Ave.
Los Angeles, CA 90066
attn Adriana Karin Vernon   (213) 827-1200

Other possible solutions for the PC include generating printer characters using "Fancy Font" (the sample text I have seen is acceptable, but I assume that screen display is normal roman font). Image Processing Systems (Madison, WI 50705) has a Proofwriter word processor which, they claim, will handle foreign characters via custom PROMs (I do not know if they also support printers).

The "ideal" solution seems to be the Xerox Star workstation. The Star is the beneficiary of the Smalltalk philosophy (developed at Xerox PARC) which is the basis of the Macintosh user interface. An article in Scientific American earlier this year ("Multilingual Word Processing" by Joseph Becker) outlines the Star's capabilities (outstanding copy, comprehensive languages). Unfortunately, the Star is very expensive ($10,000+ per workstation, plus Ethernet, dedicated file and print servers, and a Laser printer). It is also a closed box (the operating system is the best kept secret in town), and incredibly slow (I am told all the software is written in a dialect of Pascal). The Star is, however, the only "turnkey" foreign language word processor of which I am aware.

Other possibilities include the Victor 9000. Ivo Welch at Columbia University Linguistics Department is developing an Emacs/Scribe type editor that will handle 254 characters and right-left cursor movement. My own work with the Victor 9000 has produced DUKEFONT, a BIOS screen patch that allows up to 16 font sets and screen attributes to be displayed in word processing, communications, and programming applications.

Finally, Steve Haflich at MIT has suggested that some graphics terminals (notably the VT100) support downloadable character sets. Thus a text editor in a UN*X environment could display foreign language characters, and the result printed through some type of customized *roff interface. I am not aware, however, of any such product currently available.

Again, I thank all of you who were kind enough to respond to my request for information. I remain interested in hearing of any attempts to work with non-roman alphabets on micro computers, and am more than willing to pass along any information of which I am aware.

<...>

I just heard that the upgrade to the 512K Mac will cost $995.
My next question is: is Apple out of its collective mind?
I think this price is pretty outrageous. I am a firm believer that the upgrade should have been free to all current Mac owners, or at worst, available at a heavy discount. There are few reasons for this belief.

1) I don't think too many people out there will disagree that 128K is simply not enough standard RAM for serious applications work. There should have been 256K or 512K in the standard Mac.

2) There is reason to believe that there is quite a substantial extra profit margin in the price of the Mac, since Apple alledgedly considered seriously a price of $1995 before deciding on $2495. Certainly, this $500 cushion is enough to pay the cost to Apple of upgrading a Macintosh, or pretty close to it.

3) (I think I first read this point in BYTE). One of the major facets of the Macintosh design philosophy was that there would be only one standard configuration. This would allow developers to more easily implement applications, etc. since all Macs would have identical architecture. However, by offering an expensive upgrade which the majority will probably not be able to afford, Apple is creating a second standard and violating their own philosophy. Also, since most of the really useful and complex applications will be written for the 512K version, someone with a 128K version with not enough funds to upgrade will be condemned to mediocrity. The only way Apple could maintain their goal of standardization would be to offer a free upgrade to all current Mac owners.

4) Lastly, a more emotional reason. When Apple put out the Macintosh, most agreed it was pretty amazing, but seriously questioned its practicality--it seemed to be a rather experimental design. It was do or die for Apple; at one point Jobs said something along the lines that if the Mac didn't sell, the Apple would deserve a place as a second-rate computer company. They took quite a risk by putting out something so radically different than anything else on the marketplace. It turned out that many of us who saw the Mac's potential bought one, helping the machine through it's uncertain infancy and making it one of the best-selling personal computers in recent years. Now it seems that Apple is giving those same buyers a cold slap in the face by effectively making their machines obsolete, unless, of course, they can manage to come up with the exorbitant sum they are charging for the upgrade. Personally, I think this is a pretty crappy attitude.

I think the only way Apple will reconsider is if they receive an loud outcry from current Mac owners. I'd like to organize some sort of letter campaign or some such thing--I'm open to suggestions. If we can get a huge number of protesting letters pouring into Apple, maybe we can get their absurd upgrade policy to be more reasonable.

Comments?

[]

I just received my Aztec C68k development system. It looks GREAT!!!
Later on I will give a full review after I have had a chance to
roll around in it.

Results of the "sieve" benchmark (10 iterations) are as follows:

```
            128k Mac   |    Vax 11/780
            Aztec C68k |    System 5.0
---------------------------------------
Execute:      3.8 sec  |      1.43 sec (user)
in RAM                 |
---------------------------------------
Size:       4952 bytes |     5734 bytes
executable             |
---------------------------------------
Compile/               |
assemble/    69 sec    |      1.7 sec (user)
load                   |
---------------------------------------
```

Not bad for a little Mac.

yep, apple certainly charges too much for their computers.

but you other people that complain about the price being too high, and then the proce dropping, just isn't kool.

you people are being contradictory. shut yer face! what has been said by some just doesn't wash.

y'all just ought to be shot where you think, (or try to).

i don't like everything about the company, i also hat the dealers, but let's think about the alternatives.

please hmm

this subject is late.

+---------------

No, I skipped that generation. But in MY "good ol' days" an 8K-word PDP-8
(12K byte-equivalent) comfortably ran TECO (an editor), TED (a screen editor
written in TECO), and even *gasp* FORTRAN (both the compiler and user programs).
Of course, with 12K (18 Kbyte-equiv) you could run the batch system, or even
foreground/background multi-tasking real-time (keep editing and compiling while
you control and collect data from those experiments [plural] in your lab).
Oh yeah, and about a half-million instructions per second. And cheaper than
a Mac.

(So, there!)

I would appreciate any information on the quality/usefullness/price/etc.
for a package called "Simply Perfect". Supposedly it is a package
consisting of a word processor, a spell checker, and data base manager.

Also, does anyone have a suggestion of any other software that
runs on apple-ish machines and performs similar functions
with good price/performance.

A friend requested the information and I know nothing of what is
available, so any help at all will be appreciated.

Please reply to:

A while back I bought a second drive, Shugart mechanism, for my apple][.
It works OK, except that the first time it is accessed after power-up,
it apparently seeks past track 0, making the nasty hammering sound.
The original Apple drive doesn't do this. I am worried that the second
drive is having alignment problems because it occasionally stops being
able to read certain files.

Has anyone else had this problem and/or learned how to solve it?

Does the controller treat both drives equally?

I own a vicmodem for my commodore vic20 and recently bought a
macintosh. The mac has a RS422 modem port. Has anyone tried making a
cable to convert the vicmodem to RS422 or RS432? I realize this is
really off the wall but I think there is a chance to make this work. I
just don't want to be the first on the block and damage something.

Also, has anyone tried tackling the software/hardware interface to make
a commodore 1525 printer work with the Mac? I know some limited
conversions have been done with qume and epson and others.

UNIX SV_R2 private terminfo db for Apple II e/w Videx 80 column card:

The following procedures will create a private terminfo database for use
with an Apple II equipped with a Videx 80 column card. This IS vi
compatible at 300/1200 baud. The modem program SHOULD NOT emulate any
other terminal (it should pass control characters through without
conversion).

I've a procedure and termcap for pre-release 2 versions if there's
any interest.

The directory name ".terminfo" may be replaced whatever name you want.

UNIX Release 2:
(1) Enter these lines: TERMINFO=$HOME/.terminfo
              TERM=apple
              export TERMINFO TERM
    (These may be placed in your .profile if you wish to access your .terminfo
     with TERM=apple each time you login)
    This will access the apple data in your local .terminfo directory when
     TERM=apple. To use the system terminfo for other terminals, set
     TERMINFO to null and TERM to the terminal you use.
(2) In directory $HOME, create directory .terminfo (cd; mkdir .terminfo)
(3) Put the following source information in file "apple.ti"

```
#Terminfo for Apple II+ equipped with Videx 80 column card
#
#DO NOT use any terminal emulation with this data base, it works directly
#  with the Videx card.  This has been tested with vi 1200 baud and
#  works fine.
#
#Author:  Dave Christensen, IH, x4922
#
apple|Apple II+ w/ Videx card (similar to datamedia h1520),
     am, xenl, cols#80, lines#24, bel=^G$<100>, clear=^L$<250>, cr=^M,
     cub1=^H, cud1=^J, cuf1=^\, cup=^^%p2%' '%+%c%p1%' '%+%c, cuu1=^_,
     ed=^K$<100>, el=^], home=^Y, ht=^I, ind=^J, kcub1=^H, kcud1=^J,
     kcuf1=^\, kcuu1=^_, khome=^Y, smso=^Z3, rmso=^Z2,
#End of source
```

(4) tic -v apple.ti   # this compiles the source code, creates subdirectory
                "a" under ".terminfo" and places the data base under
                directory "a" as file "apple"
(7) run vi and check it out!

This works great for vi, except I've noticed in pre-R2, ^U will scroll back
1 screen, while in R2 ^U doesn't. I suspect there may be one more glitch to
iron out, anyone have suggestions?????

Also in R2 you can use the chsh command to set your default shell
to something other than sh (chsh /usr/1bin/ksh   will let you use
the 452 supported k shell as your default start-up shell).

I hope that I haven't insulted anyone's intelligence by this
but I've no idea of people's level of expertise.   Have fun.....

An early report on responses to my request for reports on the MAC at
use in colleges:

One horror story (harwdare received without software) that could
easily be someone's fault other than Apple's.

One rave for MacPascal; 40 MAC's are allowing 280 students to
learn a lot or programming.

One reminder that (some of?) the colleges have good pre-release
software, such as MacTerm.

The following individual is also using Macterminal. He figured out
(with difficulty) how to do a DB9-RS232C cable, and is now using
MACterm with a serial modem: ihnp4!stolaf!umn-cs!digi-g!brian

Please send me some more reports on large scale college MAC use.

The PDP-8 we used in high school had 16K twelve-bit words (24Kbytes)
and ran time-sharing TSS-8 with up to 8 users [8Kwords for the
operating system and 4Kwords for each user (swapped in&out from disk)].
We had a very good chess program that ran in 4Kwords (6Kbytes).

Theorem: if you have a lot of memory, you use it.
Corrolary: if you don't have it, you make do.

[]

I've recently purchased a used Smarterm][80-column card (sans documentation)
for my Apple][+. I haven't seen any recent ads for the manufacturer
(Advanced Logic Systems), so I'd like to know if anyone in netland has
any information on the following:

1. Is Advanced Logic Systems still in business, and if so, what is their
   current address/telephone #?

2. Does anyone have documentation for this card? I'm particularly interested
   in the control card sequences for activating the card's features. Also,
   a listing of the ROM code would be great.

If you can help with either of these, please respond by mail to
...!ihnp4!wucs!wuibc!etm. Thanks in advance,

Ed Macke

The following seems to have gotten mangled in transmission the last time I sent it out. So I am submitting it again. Sorry if you have alread seen it.

I just talked to somebody at MANX (Sorry! I didn't get his name.) about the prodos version of Aztec C. He said that they were shooting for getting it out by Christmas. He also said that the upgrade to the prodos version from the dos3.3 version would run 100 dollars. That makes 300 dollars for the whole package. 300 dollars was also the price he mentioned for the package itself if you didn't already have the dos3.3 version.
     However, he also said something very interesting.
The prodos version would not include the source for the dos3.3 librarys. If you want them you should ask for the 'professional' version, which would cost 400 dollars. The the prodos 'personal' version would only include the source for the prodos library. He speculated that the 'professional' package would also include the 'Z' editor (which he described as a vi-lookalike) It sounds like, unless you really want the Z editor, you should not wait for christmas, but buy now and get the add on package at christmas. The price will be the same, and you will get the dos3.3 library source as a bonus.

Adding fuel to the flames!

We have a used TEC (C.Itoh) daisy wheel printer, 40 cps, that will SERIAL interface with the Apple II series (as well as other micros).

FOB Cleveland, $350.00

Have any of you Mac users out there had a chance (or taken the plunge) to use one of the C compilers now (or soon to be) available for the Mac? If so, I would like some input as to the satisfaction (or lack of same) that you have experienced. Specific information I would like:

1. Completeness of the documentation
2. Compliance with K & R
3. Full standard library (whatever makes sense in a Mac environment)
4. HOW MUCH toolbox support and how well documented
   (Some of the products have 2 levels--how much T.B. support in each level?)
5. Suitability as a stand-alone development system (pre-supposing 512K)
6. Any other relevant comments.

I am looking for the Best Buy, so any comparative info anyone has on the relative merits/demerits of the available packages is most welcome.

I am certain I am not the only one interested, so postings to the net are probably in order. Any personal responses I will eventually summarize to the net.

Thanks in advance.

Subject:][e 80-column plus ??? cards?
Newsgroups: net.micro.apple
     O.K., gang.

     This righteous denouncer of the Mac has just (30 minutes ago)
     replaced his Apple][with a][e. I've receieved some recommendations
     for disk drives, now I want to find the best (price/performance)
     card to plug into that video slot. (As you will note from the
     below I don't have the foggiest idea what I want.)

     Microsoft has a 64k/Z80 card, discount $250. Anyone have it?
     Do you like it?

     Microsci has a 64k card for $100 (gee, that works out to 512k
     for $800 vis a vis Mac) which I will probably get.

     Someone has a 64k (expandable to 128k) for $169.

     Apple has a 64k/RGB card but none of the local dealers have one.
     (Well, one did have one but it didn't work so they sent it
     back.) I've heard rumors of third-party 64k/rgb cards.
     Anyone know where I can get one for <$200?
     *** This is what I really want -- 64k/rgb ***
